I've been getting this list for about a year. Is there an online way to join the BMHA? My name is not on the roster at the link so I'm thinking, altho I've been getting the list, I've not been a member of the BMHA like I thought I was. But the 1st question was, is there an online way to join. The second question, am I already a member of BMHA?

Craig:

I've added you using your Callbook information.
No, we don't have an online submittal form, but it is a good idea which has been suggested by several others.

As for the organizational confusion, we need to make a clearer distinction:
A) The original group is BMHA, which is where the website and (occassional) newsletters are born.
B) The Yahoo!Group was formed to complement the BMHA organization, and over time the two have come closer to merging in purpose.

I suspect that you are in the Yahoo!Group (which can be joined and un-joined individually by the web). I've now added you to the BMHA original group (http://www.BMHA-Hams.org) which requires the Treasurer and me to update the database to add/remove.

On my to-do list is to add a web page and a Yahoo!Group message to explain what I've just said above.

In the files section of the FT-817 group... there are some pics and
a schematic of a little adaptor that someone made so that you can
take a mic/headset that is designed for an HT, cellphone, and so
on and use it with the FT-817.

I've downloaded the info... looks very easy to make... but haven't tried
to make one yet.

For those that are members of the Yaesu FT-817 (FT817)
Yahoo Group... go to the "Files" section and click on the
"HeadSet Adaptor" folder to see a couple of pics and schematic
on making this nice little adaptor.

For people that aren't members of the group.... I can upload the
files to this group. When you look at the schematic... even if you
don't have a Yaesu FT-817... should be able to make some small
changes to get this headset adaptor to work with other radios.

This unit should be able to be used with an HT's mic/headset
(assuming it uses separate spkr and mic plugs), with a cell
phone mic/headset, or a computer mic/headset. Just use the
appropriate connectors for your mic/headset.

From: Joe Martine, N5USR
Topic: 1473 Message: 1478

I got a Heil single-side, intending to use it for cycling. I was disappointed to find that the default configuration has the earpiece on the left ear (which doesn't make sense to me at all, I would think for safety in any mobile situation it would be best on the right ear - at least in any drive-on-the-right country) and the only way to switch it is to cut a plastic stop. By cutting the stop, the boom can spin continuously 360 degrees. If you aren't careful, it's possible to spin it enough to damage the mic cord. (And I just KNOW I'll do that soon enough...)

Other than that, I do like how it sounds here at home. It is a bit bulky, so I haven't bothered with getting it wearable under my helmet. That would require some surgery on the helmet, and I don't have a spare yet.

I use the twenty-dollar (usually HALF that) cellphone earpieces for ham mobile use, including bicycling. I much prefer the "D-ring" styles myself. I have never been able to justify the expense of Heil style headsets since if I USE them I'll be replacing/repairing them, and the big bucks is just too much for me. The received audio quality of cell phone earpieces is great, and the transmit audio always gets good quality reports.... although most of them have lower mic output than the radio is used to, and I have to increase the microphone gain setting on the HF rig or the deviation in my 20-year old W2A HT.
When the wife gripes that her cell earpiece has died, and buys yet another one, I always snatch her throwaway unit and keep it handy for the next time one of my ham-modified earpieces dies. For monitoring only, just cutting off the stock cell connector and installing the desired earphone plug is an easy half hour project.
When bicycling, my priorities tend to change..... I don't find it fun to try to talk on the radio, though I do immensely enjoy listening to the chatter. When I'm huffing and puffing (most of the time) I don't find it desirable to transmit. I let the APRS do its own transmitting of my positions, and if I get motivated enough to actually talk on the radio I pull over and stop.

OK... I've uploaded the Yaesu FT-817 headset/mic adaptor to the
files area in this group. I didn't put it into a special folder... so the
group owner/moderator might want to move it to someplace else.

Its a 225K .PDF file. It has 2 pictures of how the device looks and a
schematic drawing. If you use an FT-817 on a bike (I've been thinking
of trying this but hasn't figured out where/how to mount it)... then the
cables from this adaptor could be made long enough so you can
mount the adaptor on your handlebar and have it reach your radio.

The adaptor has Up, Down, Fast, and PTT switches on it so you can
pretty much do what the MH-31 mic can do.

Not sure who came up with this adaptor... but the files were originally
uploaded to the FT817 group by JA4AZS... so they may be the one
who designed this.

This can be uses AS IS with the Yaesu FT-817/857/897 radios as they
all use the MH-31 mic. It can probably be used with some other Yaesu
radios without any changes. Some re-wiring of it may allow it to be use
with various Kenwood or Icom radios.

1484. Happy new year!

Yahoo group: BMHA
Date: 2007-12-29 13:23:37 UTC
From: vhuntertdi
Topic: 1484 Message: 1484

Hi group!

Mike - NF0N got me started several years ago to try to go out and
at least ride around the block once on one of the bikes
on Jan 1st, to "Start the new year off right".

Looking at the forcast for N-Y Day, I see a HIGH temp of 15F or -9C
and chance of snow flurries. And where Mike lives, its forcast
to be even cooler. Mike is a bikeing "Animal", so I have no doubt
that he will be out riding at least a couple of blocks NY Day.

I, how ever, think I will have to pass on the NYD bike ride
and will just send along best wishes that everyone has
a Happy New year, and that you all get lots of 'road time' in '08.

I have plans to do that but I'm waiting till most of the kinks are worked out of it. I figure summer 2008 aught to be a good time to get it. I plan to use the FTM-10SR because of it's smaller size and lower current drain. I'm researching Bluetooth headsets now.

I was also wondering if anyone has heard any rumors of an HT from any manufacturer that has built-in Bluetooth. It would seem logical for Yaesu to do this and release it at Dayton.

Although the FTM-10R and SR are advertised as Bluetooth-ready, it looks like you have to add the BU-1 module inside the front panel and use their BH-1 headset. Is the BH-1 any better than a standard cellphone headset? Also, is the PTT on the radio a push on- push off type, or do you have to hold it down while talking?

By default, it is hold-while-talk but can be configured for push-on, push-off.

I don't have the headset yet, I am considering adding one to my 10R - which is already mounted on my recumbent. I was *hoping* the internal mic on the front panel might work okay, but no you have to be as close to it as you would a regular hand mic. The bluetooth option is my next step - hopefully it'll handle wind better than all other mics I've tried so far...

Is there a way to use a Bluetooth headset with a wired PTT? The most convenient way to use the radio would be with a Bluetooth headset and a PTT on the handlebar. It seems to me this would be the best way on a motorcycle, too. The PTT on the headset makes no sense if you are wearing a standard motorcycle helmet. My interest is for a bicycle, but the PTT on the handlebar makes more sense there, too.

That's exactly what you have. IIRC, the headset doesn't have a PTT button at all, but I haven't actually seen one in person yet. There's a button on the control head for PTT, and it can be configured for hold-to-talk or push-on / push-off.

I haven't actually seen it in person either, but
supposedly the Yaesu BH-1 Bluetooth headset does have
a PTT on the side as well as volume up-down on the
bottom. Here is a link:
http://blog.big-dutch.com/?p=86

For bicycle use, a push-on, push-off type of PTT would
make more sense, even if it is on the handlebars.

There was also an interface in the latest QST (I think) that allowed use of any BT phone earpiece (I like to call 'em Borg implants). The push-button switch common to most is used as a PTT. The down side is that it is pricy, shipps from UK, and you still have to have the earpiece.

Can a standard cell phone BT earpiece work with the Yaesu?

Sorry, I didn't realize this was on the BMHA group. I also belong to
the Yaesu_FTM-10R Yahoo group. There has bee a lot of discussion
about the Bluetooth headset on that group. The Yaesu BT headset has a
PTT and volume buttons on it. If you have an external mic connected
and are using the BT headset, the mic PTT will not activate the
headset microphone. I'm hoping I can mount a PTT on the handlebar and
use somebody else's headset.

I seem to recall a post from the other group that said other BT
headsets work. The connect button works like a push-on/push-off PTT.

Joe,

I don't have an FTM-10R yet, but I believe you can adjust the mic gain from a menu. Others on the FTM-10R group have said this helps in a car so they don't need to be so close to the front panel. You might try that.

Well, sure enough. I had forgotten all about that extra set of menus.
I was scrolling through the "regular" menu and of course didn't see it.
Teach me to stash the manual away...6t

When I'm riding, the control head sits on top of my handlebars directly
in front of me, maybe 8-10" from my face so hopefully that will do the
trick. Of course, then I have to see how bad the wind noise is...!

1496. RAGBRAI APRS

Yahoo group: BMHA
Date: 2008-01-09 14:19:49 UTC
From: compwhiz80
Topic: 1496 Message: 1496

Well the first phase of the plan is complete. I most all the equipment put together and trackers ready for use. I have 3 portable fill-in digipeaters and 2 iGates that can be set up in dead zones along with a neat setup to help relieve some of the congestion that might occur on the main APRS frequency. Also a setup using MURS for unlicensed riders/support. Now to see if I can get the RABGRAI admins to let me work with them on it. They don't seem too interested.

I see that many of you all ready use APRS. Do any of you by chance ride RAGBRAI? I don't believe I saw anyone say whether or not they did.

The trackers are composed of a small deluo GPS with a homemade interface to a small transmitter from Radiometrix. The system is powered by a small 12v gel cell battery and in testing will run 4 days continuously at 300mw or 3 days at 4 watts on a single charge.

Although these are "dumb" positioning transmitters I did add a neat feature to the device which sends out preprogammed messages when switches are activated. They could be used for emergency beacons or other events.

I only have a simple wire antenna designed for them, just wasn't sure if anyone would put a bigger antenna on their bike. The last responses I got on another board were all concerned about the 4-6lbs of weight.

From: compwhiz80
Topic: 1496 Message: 1498

I don't really need anything from RAGBRAI. It just would make life easier having more access along the route. I've got everything set up for 10 minute intervals and that seems about the minimum for the number of trackers that is planned to be used.

The idea is to use RAGBRAI for a test of the system that could be a temporary set up for any other large scale events. I just picked this event out because where else do you get a 60-100 mile stretch that's 7 days in a row with each day in a different area with different conditions/terrain etc?

In addition to bicycles I'll have trackers in some emergency vehicles and support vehicles.

It's a pretty complex setup that I could do all myself, but I'm waiting to see where the route ends up and hopefully can enlist the help of some local clubs.

I sent and received a reply from Yaesu a couple days ago. They said that they don't have any Bluetooth capable HT now, but they might have one in the future. Stay tuned!

I also read an article in MRT magazine today that Klein is introducing their Blu-Comm Bluetooth headset for Motorola and Kenwood HT's. It is supposed to list for $139.

I just mounted my ftm-10r in my velomobile. I don't have the antenna mounted yet, and I don't have power! I bought a voltage converter to convert the 48 volt system to 12, but that isn't going to work for my application. I now need a seperate battery (and want to sell that converter!). I plan to operate at reduced power... the lowest most of the time. Any thoughts as to best setup for a battery... anything ready to buy with a small charger?

There are videos of the bike, but not the radio yet, if you search for Auroa velo on youtube.com

Thanks

Bryan

This is not hard, you should be able to build a 48v to 12v 10 amp regulator. Plenty of good circuits that you can find on the web. Not sure why the voltage converter will not work but a 12v 7a gel cell battery like the kind they use in a computer battery backup has always worked very well for my FT-817

OK. Thanks. I already have 2x 24V, 18Ah, Nimh batteries. I guess lead acid will do for the rig. Its simple anyway. I can't use the 48 to 12 converter because they used two 24v packs in series, then use two 24 volt chargers in isolation to recharge them. I want 12v at all times so it can run an alarm as well. Since the two packs are no longer in series during recharge, I can't use them.

So buy an isolator or build an isolator with two big diodes and pull your 48 off that for your converter. Then it will not affect the charging issue.

1504. Low weight, high engergy density battery..

Yahoo group: BMHA
Date: 2008-01-14 18:25:03 UTC
From: Arnie Grubbs
Topic: 1504 Message: 1504

Hi group!

Well, I found this battery is very interesting, and thought you might like to check it out.
High energy density, fast recharge time and low weight great for bike
and can produce a very high output current if needed.

http://www.hfprojectsyahoo.com/pplina30popa.html

They are using some of these batterys in a 36 volt configuration to power
a 100watt HF amp for back packing use.

Check out the spec's on the battery here on this page compared to
a "lead acid" battery..

http://site.hfprojectsyahoo.com/power_pack

Note the 15 min. recharge time!

Hope that helps in looking for a battery. Its not cheap but
I guess you are paying for light weight, and high power. Things
you want on a high performance bike!

Heres a quote from an RC airplane web forum about using the battery in
a high discharge rate application:
Quote----
The 6-cell pack built here has a open circuit voltage of 6 x 3.6 volts per cell for a total pack
voltage of 21.6 volts, and has a capacity of 2300mah. The pack can deliver 30C continuous (69
Amps) with burst capability of 40C (92 Amps). I am currently running them in my 150% F-4 and 166%
F-18 ParkJets and in both planes I am pulling 35 Amps (15.2C), and getting 5-6 minute flights with
300-400mah left in the pack at the end of the flights. At this current draw, the A123 6-cell pack
delivers 17.2 volts or 2.867 volts per cell. In this application, the packs are delivering 17.2
volts x 35 Amps or 602 watts, which is pretty good for a battery pack that weighs just 1 pound!

------End of quote

Beware of fire danger with high energy density batteries. Some of the RC folks require recharging in a bucket of sand to protect against fire/explosion. When I searched for a battery pack to power APRS on a bike, I was intrigued by the Li-ion capability but the recent battery recalls cast a different perspective on the matter.

1506. Low weight, high engergy density battery.. > From: tobymarkowitz

Yahoo group: BMHA
Date: 2008-01-16 18:13:35 UTC
From: Arnie Grubbs
Topic: 1506 Message: 1506

Yes, there could be some problems with just about any high
power battery, but the cool thing about the A123 type of
Lithium nano-phosphate cells is that they are much less
reactive when the cell is breached.
Check out this video where they drill a hole in both types...

http://www.ecogeek.org/content/view/876/

The first battery is one of the new type.. while it hiss's
and steams a little, it does not come apart or breath fire!
The regular LiIO battery just about flys out of the picture
on a rocket like tail of fire! :)

Oh, and btw - I have nothing to do with A123 batterys, I
just saw them on the science channel on TV!

1507. Dayton Hamvention 2008 BMHA Forum Announcement

Yahoo group: BMHA
Date: 2008-01-24 22:00:32 UTC
From: Mike Nickolaus
Topic: 1507 Message: 1507

Dayton Hamvention 2008 BMHA Forum
The 18th Annual BMHA (Bicycle Mobile Hams of America) forum will be held at the Dayton Hamvention on Sunday May 18th, 2008. Mike Nickolaus, NF0N, will be forum moderator.

I am looking for Forum speakers and presenter's for this years Forum. The hot topic seems to be Bicycle APRS, is there any one who would like to present at the forum? Please contact me at nf0n@....

Room details and forum time will be posted on the BMHA website: www.BMHA-Hams.org and the BMHA Yahoo Group as they become available.

I might bring one of my bikes. Perhaps the fixed track bike would be a conversation piece. I still need to finish taking some pictures of them for the newsletter.

1509. RAGBRAI Route Announced

Yahoo group: BMHA
Date: 2008-01-25 04:23:58 UTC
From: Mike Nickolaus
Topic: 1509 Message: 1509

For those who have an interest in RAGBRAI, Registers Annual Great Bike Ride Across Iowa, the route for 2008 has been announced.

Here are the start, overnight towns and ending town:

Missouri Valley (north of Council Bluffs about 20 miles)
Harlan
Jefferson
Ames
Tama-Toledo
North Liberty
Tipton
Le Claire

This is the first time RAGBRAI has ended at Le Claire.

Team Megacycles, a team of about 12-15 Ham's will be riding again with our support team. Several of us hope to have APRS aboard the bike again so look for us.

The website for RAGBRAI is: www.ragbrai.org

Mike, NF0N

1510. PAD Rally

Yahoo group: BMHA
Date: 2008-02-09 18:45:21 UTC
From: Norm Huber
Topic: 1511 Message: 1511

A long time ago we had a net on the HF bands. Is there any interest in
reviving it? We are in a new sunspot cycle and it might be fun again.
I was thinking of sideband net on an appropriate band for the time chosen.
Think about it, It's pretty poor riding weather here in the Midwest
right now.

Norm,

Let's give the HF net a shot. I think it should be weekly, and after a few times it will get some traction.

Pick a day, a time and a frequency.

Sounds like a good idea, I'd like to try it, but the net starts
in 15 min, and I am not at home.

I'd like to see it maybe an hour earlyer, as I leave for work at 3PM
central time every other weekend. (I work next weekend)..

Anyhow.. hope you guys have good luck!

I haven't heard anyone on 14.280 except those running linears and DX station with QSB. We'll try next Sunday. We have one member for whom this time slot didn't work.

Who can adjust?

Who can't?

Does it need to be in CW?

Maybe we need to start a poll?

1530. New poll for BMHA

Yahoo group: BMHA
Date: 2008-02-10 21:30:03 UTC
From: BMHA@yahoogroups.com
Topic: 209 Message: 1530

Enter your vote today! A new poll has been created for the
BMHA group:

The BMHA HF Net.

What changes are needed?

o Do you want to keep it SSB?
o Is there a better frequency than 14.280?
o Is there a better time than 1600 EST?
o Who would rather have it in CW?
o Is Sunday okay?
o What other options am I forgetting?

To vote, please visit the following web page:
http://groups.yahoo.com/group/BMHA/surveys?id=2655197

Note: Please do not reply to this message. Poll votes are
not collected via email. To vote, you must go to the Yahoo! Groups
web site listed above.

Thanks!

From: Lynn
Topic: 1531 Message: 1531

The poll didn't allow for any exhange so here is my 2 cents.

Sunday at 1600 EST is fine. Would anyone be interested in a psk? Or what about 30 meters? I work a lot of digital modes and psk gets past the cramped bands of ssb. I hope to be running a bike mobile digital station this summer on our local bike trils. But I'll go with the group. Lynn - KB3FN

From: vhuntertdi
Topic: 209 Message: 1533

Im not sure how to go about a pole that you just check the answers, when you are asking several questions......

I'd like to keep it ssb for now.. some people are not up to high speed CW.

I am wondering if some other freq. might be better for the time picked. At the time the net was supposed to go on, the band was very long, I was hearing a lot of DX. Would 40 M be better?

Like I mentioned earlyer, I'd like to see it earlyer in the day, then I would be able to check in on the weekends that I have to go to work. (I work 4PM to 4AM)

Just some thoughts! 73 - Arnie KA0NCR

1536. Re: New poll for BMHA PSK

Yahoo group: BMHA
Date: 2008-02-10 22:03:50 UTC
From: vhuntertdi
Topic: 209 Message: 1536

I wonder about PSK, as it is not as widely available mode for general "ham" bike people as would be on SSB. Might be better for the net to stay on SSB.
That said, I am getting ready to try PSK, and will have 2 different units that I want to try out on the bike. (trike actually).

One is with my Dell Axim X51, and the other will be with a NEU-PSK unit from AmQRP. (http://www.amqrp.org/kits/nue-psk31/index.html)

Probably will run one or the other with a SWL PSK rig, which I am ordering a kit for. Not sure which band to get though.. With Xtal control and low power required should be nice for the bike! Also as a kit it is not that expensive if you happen to wreck it some how!

LINK to the TXcever I'd like for the bike.

I was planning to look for a rigblaster at Dayton. Till then I'm not ready for PSK. That sounds good though. As the fellow in CA said to me, I was making a good trip on 20 M but the path was in high sun. The East coast was going away (already gone?).
I'll be glad to help with the Net Control if we need get the coverage across the country.
CW is not my cup of tea. I had to wait till last January to get on HF.

Topic: 1539 Message: 1539

A good choice for a net might me 17 meters. There is no contest activity and the propogation is usually pretty good in the afternoons. I thought 20 might have more of an appeal since just about all hf radios have that band, not all (including me) have 17 meters. I'm using a vintage Ten Tec Argosy, without the warc bands. Though lately I've been purusing the swap sheets for something cheap that covers 17 meters.

This afternoon propagation was pretty bad for the west from here. I hear mostly stations south of me. I too heard the spanish stations quite well here. Just before nettime I worked a station near Pittsburgh, that sounded like a local. Pittsburgh is about 200 air miles from here, so propagation was wierd for 20.

Now the introduction. I've been a ham for 42 years (xWA3FWQ) and an adult cyclist for 26. My amateur activity is mostly qrp Cw on the hf bands, with some 2meter 440 fm mobile activity. My BMH station is just an APRS set up in the bike bag. I had a FT817 and hamstick for the bike, but found I liked riding too much to be fiddling with a hf radio.

I've been riding recumbents since 1998 and my current main ride is a Bacchetta Giro dual 26. I also have a Catrike Road, and a Bacchetta Giro 26x20. I average around 3400 miles a year on the bikes. I live near the New York State Finger Lakes region.Since my home, Sayre, Pa, is very close to the New York State border, a large percentage of my daily cycling is on NY roads. The area is not greatly populated and the secondary roads are choice, with wide shoulders and low traffic.

If you ever get up to this area, drop me a pm and I can point you some of the best cycling your likely to find. Ah, but thats just my opinion.

Norm,

You and Johnny, in Colorado, might make a hot team for covering coast to coast and some.

After spending a lot of years on flightlines my ears don't work very good (ask KC7BSY). About ten letters sound the same to me. I create a lot of unnecessary chaos.

My only digital interest is CW. In fact, I have a brand new KAM XL that's never been out of the box I'd like to sell so I can buy a KX1...if anyone is interested....

Denny,

Good information. Good ideas.

I, too, do QRP CW. Today for the net I had my power turned up to 80 watts. I can'r recall the last time I was on SSB and it's been even longer since I operated more than 3 watts.

Finger Lakes. Been there. Great country. So is all of New York and Birkshires (sp).

My bicycle mobile has actually gravitated to bicycle portable except for 2m simplex.

1543. Free WiFi at Starbucks

Yahoo group: BMHA
Date: 2008-02-11 22:35:58 UTC
From: Clint Bradford
Topic: 1543 Message: 1543

You're half-way through your leisurel weekend bike ride, and stop a Starbucks for some decaf...Well, whip out your wi-fi device, because...

Starbucks announced today it will give most any customer two consecutive hours a day of free Wi-Fi access. Specifically, that offer applies to anyone who uses its prepaid Starbucks
Card at least once a month. That represents as many as 60 hours of access for the price of one $2 cup of coffee.

The offer comes as Starbucks switches the company providing it with wireless service to AT&T from T-Mobile. Most of AT&T's broadband data customers will also have unlmited free access to Wi-Fi at 7,000 Starbucks. They have already been able to use AT&T's other 10,000 hotspots free.

1546. Re-Try for HF net this Sunday?

Yahoo group: BMHA
Date: 2008-02-15 18:09:42 UTC
From: Luis
Topic: 1546 Message: 1546

Hey folks...

I say we keep trying for our Net. I can monitor 20m and 40m simultaneously. So what say? Keep trying for 14.280 +/- 5 and on 7.280 +/- 5. Still keep the 1600 Eastern time, 1500 Central, 1400 Mountain, and 1300 Pacific schedule? I can be on the air earlier if need be. So let's do it! I'll call CQ from Victoria, down in south Texas on both bands and see who picks up what and where. IF we can make contact with even a couple of us, we can think of a preamble or find the old(?) one later. But for now, I think trying to reach out and contact each other is primary.

Best of 73!

Luis KD5KJD
Easy Racers Sport currently running VHF/UHF (Icom 32A HT or T90A, occasionally the Icom 2100H), modifying the HF stuff (Icom 706 MkIIG) and adding APRS (Byonics everything).

Hi Norm, nice to chat with you Sunday. I wish I could have stuck around. Next week I should be around all afternoon.

I talked with Mike NF0N on the phone on the way to work yesterday and mentioned the net.. He said he was going to be traveling for a few weekends so probably wont be on the net unless he checks in as a mobile, but he might supprise us!

I see that you are in Bloomington, IL. Mike and I will be passing thru there in May on the way to the Dayton Hamvention. Will you be at the BMHA forums this year? If not, we will have to wave at you on the way thru your town and give a shout on one of the repeaters.

I do hope that sometime this spring/summer what with the solar cycle getting better to be able to check in to the net trike mobile. I have been thinking all winter about putting some equipment on one of my rides.

Heres a link to a few pictures of my trike, less radio gear for now.
http://vhunter.smugmug.com/gallery/1591463_W3suf#77155152

Check out a few of the other bike and ham radio pages on my picture server if you like. There are several folders of bike ride pictures at
http://vhunter.smugmug.com/Other/14477

Check out the folder for RAGBRAI '05, there are a number of pictures in there of 'team MegaCycles'.

If you ride RAGBRAI this year maybe we can work each other on VHF or UHF! I am hoping to go again this year with 'team MegaCycles'..

When I've had trouble with schedules with my friends we have used EchoLink as a back up. If there aren't too many stations a couple of leads with at least a DSL line can be connect points or a conferencing node can be used.
I know it's not radio, but if you haven't tried it!... We've found it a lot of fun and it does keep us in touch until the bands improve.
Sunday, 20M in Florida was a bust and 40M was just too noisy here. (1600 hours) EchoLink is always Q5 and S9.

Mark, W4FJE

I'm going to be working this weekend so I will not be on the net.

I sure will be at Dayton. I was planning to bring my track bike (read
about it when you get your newsletter) and even try to ride if there is
a ride Saturday.

Interesting. Great pictures.

The idea of Echolink is a great idea as an adjunct to the net is great
by me. I participate in a net our motorcycling radio club has in the
California area weekly. That is when my computer co-operates and lets me
hook up. I'm listed as N9ZKS, Shamrock Illinois.
I've been keeping the computer on for possible emails anyway.
73 for now.

1560. GMRBC 2nd Annual Recumbent Rally June 21

Yahoo group: BMHA
Date: 2008-02-22 23:00:12 UTC
From: shepner2000
Topic: 1560 Message: 1560

Wanted to let everyone know that the Greater Milwaukee Recumbent Bike Club (GMRBC) will be hosting their 2nd Annual Recumbent Rally on June 21 in the Milwaukee, WI area. While we are a recumbent bike club, any HPVs are welcome and Id really like to get a few BMHA members to show up. Would like it even more if I can get a few BMHA members to volunteer too :)

For more information and registration: http://www.gmrbc.org/

Topic: 1562 Message: 1562

Hi BMHA,

I'm a relatively new operator and I'm planning a bicycle tour along the Pacific coast from Seattle to SF. I'm thinking of bringing my mobile with me to tinker with. What would be a good way to get the repeater frequencies for my route?

Thanks,

John

John,

By all means, take your radio. Try this website for a list of
repeaters covering the area where you're traveling.

Get yourself a copy of the ARRL Travel Plus disk. You can trace out a route on the map, pick the frequencies, and create a list of all the repeaters at any distance from your route you choose. It will also export these lists in a format that can be used to program those radios with computer programming capability. You can even have the computer display those repeaters within the chosen range as you drive if you have an attached NEIMA GPS.
Downsides - Many of the repeaters in the directory are not active. One could believe there were no hams there. Calling may get some lurker to reply but it can be fairly lonely out there. My source of this is the last 100,000 miles of riding my motorcycle across the country using my D700 and the above program to load the repeaters along my routes.
Good luck, good ride!

John,

It's me again.

Don't forget about simplex on 146.520. You'd be surprised how many folks monitor that frequency. When I travel I always stay on 146.52.

There's an organization you might want to visit and make some friends before your departure.

I rarely try to transmit while bicycle-mobile, but often enjoy listening to the chatter on the radio while pedaling along... I use a "D" style earclip cell phone earpiece with my desired HT-audio-plug in place of the cell phone connector that provides good audio for reception. Using the boom mike provides good quality audio but it's low enough that I need to either crank up the deviation or install some sort of preamp inline. But again, with my chronic shortness of breath while pedaling, I rarely transmit anyway. Even then, it is handy to have the radio along.... if someone engages in a subject that I wish to contribute to I normally pull over somewhere and chat for a few minutes before saddling up again. I let my TH-7D (Or IC2AT with TinyTracker) do the auto-transmit-my-position thing while I ride; that requires no "fiddling while pedaling".

TravelPlus for Repeaters CD-ROM
-- 2007/2008 Edition. Version 11.0
With TravelPlus for Repeaters™, you have the power of The ARRL
Repeater Directory(R) on your COMPUTER!

Make TravelPlus for Repeaters™ your traveling companion, and you'll
never be alone on the road. Locate ham radio repeaters along US and
Canadian travel routes using this map-based software. Fast. Powerful.
Flexible. Convenient.

Map your travel route and tune in. Supports GPS (with separate
external hardware*).
View and print maps and repeater lists
Access The ARRL Repeater DataBase, global Internet linked nodes, AM/FM
radio, broadcast television, and NOAA weather stations. NEW - Now
including points of interest for radio-related sites and museums.
Export data. Transfer to Palm™ or Pocket PC, radio programming
software, and more.
Requires Microsoft Windows 98SE, XP, or Vista, and a Pentium or
comparable processor.

http://www.arrl.org/catalog/?item=9930

The ARRL Repeater Directory (Pocket-Sized Edition)
-- 2007-2008 Edition
(Size 3.25 x 5.25 inches)
Choose this pocket-sized book, or the NEW Desktop Edition...or BOTH!
Includes 20,389 listings for VHF/UHF repeaters across the US and
Canada.

New Features!

D-Star and APCO 25 Repeaters
Includes:

Repeater operating practices, repeater lingo and hints for newly licensed hams
Frequency Coordinator contact information
Using CTCSS tones and Digital Coded Squelch (DCS)
VHF/UHF Band Plans and 2-meter channel-spacing map
IRLP (Internet linked) nodes
Tips for handling interference
IRLP, WIRES-II, and Echolink (Internet linked) nodes
Emergency Message Handling procedures
Transceiver Memory Log

I would take a pad and write down the repeaters
that I thought I might be able to get it to.
Make sure you also write down the PL.
If you are like me, I need the radio manual to put in the Freq.
and PL.
Save peddling and enjoy.
Bob

No responsible bicycle rider should use an earpiece of any kind for
telephone or radio communications while riding.

Both ears need to be available for safety's sake.

A securely mounted HT, coupled with a speaker-mic with a secure clip,
can safely be used while mobile.

Here's a couple photos of the RAM mounting system for HTs:

It was informally decided a few weeks ago that we would try to see if we could have a net on 7.280 and/or 14.280 on Sundays at 3 PM Central Time (DST or Standard) I did manage a QSO with KA0NCR in Nebraska this afternoon. Conditions are going to get better.

It would also be great if any of the BMHA members check in regularly to nets that we publish that through the group.

Hope that answers your question.

I have posted pics of my new setup. Please browse them and tell me what you think. I am very interested in comments and pics of grounding and antenna setups. Would also like to know of antennas. Best antenna for HF ops. I have a buddistick and MP-1 but feel they may not be sturdy enough. Do I need drag line or is the bike going to be an adequate counterpoise?

Here is my attempt at HF bicycle mobile.
http://www.n0lx.com/bicycle_mobile.html

I followed my long-standing tradition of using shortened half wave antennas. This one was 13 feet tall, and good on 17 and 20 meters as described on the page.

I once ran 20 watts through an Icom 706 mounted on the bike rack (with the head on the handlebars) and worked New Zealand from Colorado. Here is some audio from the QSO with Warren, ZL1AIX:
http://n0lx.com/zl1aix.MP3

And here is a brief description of the story and the matching unit I made for non-QRP work:
http://www.n0lx.com/zl1aix.html

I don't have details on the 13-footer, but here is a 14' version I made for 10-20 meters.
http://www.n0lx.com/short_5_band.html

Running 20 watts, I found it necessary to run a short lead from the match ground to the bike rack to give me 1:1 SWR.

Ooooooooooooo! Tell me what you have planned with the kite supported antenna from the bike!

I've played with a "kitoon" balloon/kite combo from a stationary bike - and was impressed with the difference to a whip antenna. Think we can whip up something that will function while in motion?

From: David H Hatch
Topic: 1575 Message: 1584

Ron asked,

"Think we can whip up something that will function while in motion?"

Dave, the new guy, replies.

Should be fairly easy, just would need to be clear of power lines and trees, so it's about location. A smaller kite reeled out from the top of a fiberglass mast, will work, I'd think. I am the student here.

I have some interest in a bike-loop, and have not tried it yet. Here in Wisconsin, seems the trend during cabin fever season is that we folks are long on ideas and short on follow through :) .

Sincerely,

Dave-N9ZRT [Hi Jake - Glad to see you here!]

I'll guess (after seeing your home page) you have the smarts to try this safely .. if you try it at all .. but to the rest of those folks on the list .. trying something like this is an accident waiting to happen.

There are numerous potential problems with a kite lifted antenna from a moving bicycle.

1. Static electricity. How to remove the static build-up on the antenna wire so that it doesn't fry your radio.

2. Keeping the kite aloft. Crosswinds and tailwinds moving the kite over to one side or it will reduce the "speed" of the wind .. and thus the kites altitude. A headwind will obviously increase the "speed" of the wind .. the problem with that is that it may just go over the wind range that the kite is designed for .. making it unstable. Making sure that the kite (or kite line / antenna) does not get caught in .. power lines, telephone lines, telephone poles, trees, buildings. What happens when you come to a curve in the road? (the direction of the "wind" changes .. will that be a problem?)

3. If the kite line / antenna DOES get caught on an object .. will it jerk the bike out from under you?? OR do you have some way of an automatic quick disconnect? (or will if rip the radio off the bike?)

4. There is no practical way to watch the kite behind (and above) you and the road ahead. While many times a kite will fly "unattended" .. many times they don't .. how do you tell when it needs attention?

5. If the kite comes down .. you'll be trailing your antenna behind you. What happens if a car drives over that antenna while you are still pedaling? What if the antenna wire get caught in a moving vehicle?

From: Ron Baran
Topic: 1575 Message: 1587

So, what prompted you to spill some reality on my winter fantasy, Richard?

Not sure if I have the smarts to handle the kite on the open road. I was thinking about Field Day. I have the very large open field with no obstructions ... and I need to get the entire antenna length to over, say, over 25 feet long so my AH4 will tune and get out - kind of - on 80 meters. Various experiments with 80 meter bike antennas have ended with me yelling into the wind.

I need to go 14 feet longer than my 102" whip. In the past - but stationary - I've used a kitoon and run out 300 feet of wire - and that's what gave me the idea.

Now, if it works I get to spend Field Day riding back and forth over a big lumpy field trying to send CW. Nah, never mind.

But, in all seriousness, Richard, thanks for you comments - you obviously, know a great deal more about kites than moi.

No, there is not, and I've been tied up out-of-town and haven't had a chance to try my luck from the Left Coast.

This is a good idea, and if someone would like to send me a schedule (including the assurance that we have at least one person guaranteed to be available as Net Control from somewhere in the USA), I'll post it.

At this point, I would prefer specific dates/times and not a general plan such as "every Sunday from 2:00 to 3:00 UTC".

Just email me the particulars at BMHA-Webmaster@..., and I'll get it on the website (http://www.BMHA-Hams.org) within a day or two.

1592. The last word on WHOISBIKE.COM. Use of this newsgroup.

Yahoo group: BMHA
Date: 2008-03-13 16:56:46 UTC
From: slafetra
Topic: 1592 Message: 1592

There is a reason why messages are moderated in this newsgroup (Scott KE6WMF, the original moderator, found that this was the best way to control "browse-by" spamming).

At the same time, the set of moderators have tried not to be "heavy-handed" and include as much bicycle and ham - related information as struck us as useful to the group (note that bicycle + ham is not entirely required, but information of simultaneous interest to both groups is especially desired and encouraged.)

From the responses received, it appears that WHOISBIKE.COM does not meet this criteria, and the moderators will stop accepting posts on this specific topic (this includes discussion, but you can freely send email to the moderators and if appropriate, we will summarize to the group).

I am not criticising those interested in WHOISBIKE.COM -- it has a place in the Internet. We are simply declaring it "off-topic" for this group which is specifically about the intersection of bicycling and ham radio. There are many general-interest bicycle groups where the posting would be considered appropriate.

Summer is approaching, and it is time to get out on the bikes and ride. The sunspot cycle is (slowly) gaining momentum so we can talk also.

Cheers,
- Skip AA6WK

1593. Two-way Mobile Radio Ops Exempted in CA

Yahoo group: BMHA
Date: 2008-03-15 06:23:09 UTC
From: Clint Bradford
Topic: 1593 Message: 1593

I am assuming this applies to us bicyclists...

Amateur Radio Exempt from California's New "Hands Free" Law:

On July 1, the State of California will have new laws on the books to deal with the use of wireless telephones while driving. There has been some confusion as to whether California amateurs who operate in their car will be affected by the new law. According to the California Department of Motor Vehicle's Web site...

http://www.dmv.ca.gov/cellularphonelaws/dl208_03cell_phone.pdf

... "the use of dedicated two-way radios such as walkie-talkies or Citizen Band (CB) radios is not affected by the new law" for drivers 18 or older.

1594. New Rider looking at gear

Yahoo group: BMHA
Date: 2008-03-15 11:36:41 UTC
From: Kevin GIlday
Topic: 1594 Message: 1594

Hello all

I am getting into biking in a new way and combining it with my other new avocation, Ham Radio.

I mainly started riding (other than around the neighborhood) to act in a support role for my wife while she runs Marathons and "Ultra" trail runs (50 Miles).

I will be using a Yaesu FT60R and a garmin NUVI 200W while huffing and puffing around the courses.

I am looking for some appropriate method for mounting the Garmin on the handlebars. It would be nice if I could see it (hi hi). I haven't even thought about APRS (past dreaming about it that is) and just want the basics right now.

If I survive this year operating bike ham/support than I will look at more exciting things for next year.

Also, I am looking at a Topeak MTX intergrated pannier and trunk for the bike. I already have the Topeak rack system and have the small MTX bag. I have already decided that I need panniers, is the MTX system a good one?

One other thing - There is an event in southern Michigan, the Metro Grand Spring Tour starting near Monroe/Huron Twp on May 4th.

WWW.lmb.org/dcc/mgst/

Looking for other hams who might be attending this one, I have signed up for the 25 mile portion and am currently burning up the stationary bikes at the gym in preperation. If anyone else is riding this one let me know.

Thanks
Kevin

Take a look at the latest newsletter for a couple of solutions for
mounting radios. I have ridden a good number of miles without problem
with both a fixed gear track bike and the road bike.
Anyone using one of the suspension fork bikes should have less worry
about shock etc. Good luck.

Well... you may have to look into another GPS unit if you want to do APRS. I believe the Garmin NUVI units only have a USB output on them and not a serial output. Some of them have a data output on them (I guess some of them have some sort of "fleet tracker" feature in them)... but the word in the TinyTrak and other APRS groups is that its a proprietary Garmin output and not an NMEA output.

At the moment, I have an old Radio Shack "handlebar" case that they sold I think for their FRS radios. Unfortunately... they don't sell that anymore. I'm currently using a Garmin ForeTrex 201 on the handlebars of my mountain bike... but I think I'm going to get a RAM handlebar mount for my Garmin GPS III+ (so I can have "maps" on the screen as well).

Subject: [BMHA] New Rider looking at gear

I will be using a Yaesu FT60R and a garmin NUVI 200W while huffing and puffing around the courses.

I am looking for some appropriate method for mounting the Garmin on the handlebars. It would be nice if I could see it (hi hi). I haven't even thought about APRS (past dreaming about it that is) and just want the basics right now.

Well, my first thought was to suggest going to Garmin and getting a handlebar mount. Hmmm .. they don't offer one. There must be a reason. YES, this unit is NOT designed for operation in the rain.

If you insist on doing this you also must consider the battery life of the unit, or will you be lugging around a 12v battery to power it?

Hey Kevin. Couple of comments..

If I were getting a pannier, I'd look at getting one that is waterproof. I'd have to dig out mine but the one(s) I have has a top that rolls up and seals. These are very nice to put in expensive electronics when the clouds open up. Been there done that. They also float. (Don't ask me why I know!) I used these for touring for many months in a row and they are great.

As for mounting stuff on the handlebars, I have a friend that uses GPS systems a lot and never did find a good, secure way of mounting them. The garmin you selected would be really nice but I've never seen the back of it so I can't help you there. I have, however, mounted things like my 817 in a simple handlebar bag on the handlebars and then used shock cord to keep it secure. My standard "pre flight" before a ride was to pick up the bike and drop it about a foot. If nothing moved, I as good to go.

One last comment about trunk bags. I like them and use one on almost every ride but be careful buying a big one. You will end up filling it up, no matter how big it is!

My wife also is a runner. However, some of the runs she does here in Colorado climb several thousand feet! I tell her she is on her own on those.

Good luck and let us know what you come up with.

Bruce

From: ka0daq
Topic: 1599 Message: 1599

Good Morning All:
I am not an official member, but have been reading the message board for about a year now. I have added a photo of my cheap and simple radio mount. I hope this will encourage every ham with a bike to try bicycle mobile.
It's a handlebar bottle holder ($9) a bit of foam for padding and two bungee cords ($1). This works well. I use a hand speaker mic, but will change to a headset this year so I can keep both hands on the grips.
I've added a safety flag/j-pole antenna for increased range.
Only put on 250 miles last year, aiming for 500 or more this year. I may mount my IC-706 and get out on the Woebegon Trail this summer.

I certainly wouldn't rely on panniers to be waterproof. ZipLock makes many sizes of food bags that you can depend on and are easily doubled and/or replaced. They're cheap. That goes for clothing as well as electronic stuff, maps and journals, and cameras. I would bring many extra bags and most certainly double bag the stuff that can't tolerate water. Hard lessons are long remembered.

Ten years ago Barb and I took a Burley tandem trip from Williams, AZ to Grand Canyon and back to Williams. On the return trip rain came sheets. Speeding Tour Buses doubled the amount of water we had to deal with. It was a horror story, a saga.

Barb had insisted on ZipLock bagging everything. And I'm glad she did.

While we were soaked to the skin and pouring water out of our shoes, everything that truly mattered was powder dry.

Hi Scott,

No doubt about ziplocks. Cheap, light, and if done right can save
equipment.

Here is the link to the panniers I use.

http://www.ortliebusa.com/cartgenie/prodInfo.asp?pid=31&cid=2

Unfortunately, they don't really show the roll up closing scheme.
I've had great luck with these. Toured all over Europe with them.
(OK, I admit that I still used a ziplock bag or two now and then!)

73,

Bruce KG0SH
Golden CO.

P.S. I know what you mean about being soaked on the road. Did the
logging trucks in the rain once that wasn't a lot of fun either!

As to GPS on a bike with moving map, I use Garmin eTrex VISTA C. Garmin makes a handlebar mount and it has been through multiple rainy rides. I use this instead of a bike computer although I often wear a Polar heart rate monitor (725) when riding. I purchased a new bike last summer with carbon bars that did not accept the Garmin mount so purchased a "NOB" which can mount on the stem and then hold the GPS mount. This was better than mounting the GPS on the bars in that it was a bit more aerodynamic and easier to reach. The Vista C has a USB connection but my older Vista uses serial.

If you want moving map, the Vista C works well and you might consider one of the Garmin 60 models. I, too, looked at the nuvi units for a friend and saw they were not intended for use in rain. For APRS, there are a number of small GPS units that can be connected directly so keeping your moving map separate from position reporting.

It would seem natural to use one GPS but they are small enough you might consider separate units. I purchased one from Rikaline that seemed to work well. The SiRF-3 chip (I believe this is the one) seems to perform quite well so you might check what GPS chip is used when shopping.

From: jimdevenport
Topic: 1594 Message: 1603

I have been riding with my GPS mounted in front of my handlebars for over a year, with no damage, even surviving being knocked down and dragged several feet in and intersection(!). Me, bike, everything. Lost a rear brake lever and the 1/4 wave piano-wire antenna off my D7. But the GPS survives fine. I started using just stock alkalines but they tend to only last maybe 4 or 5 days with 3-4 hours a day of bike commuting. I switched to Lithium AA's, which are VERY expensive but last about 5 times as long as alkalines, and pulling off the road to change batteries in the middle of a bike ride is not my favorite activity.
This floppy 1/8" aluminum bracket started as a lashup, and I thought the flopping up and down whenever I hit bumps would be intolerable, but as it turns out it really works well AND provides a very safe mount to prevent the GPS from self destruction from vibration as I ride.
Here are images of my homebrew bracket for my Magellan Gold:
http://www.qsl.net/w5aox/images/APRS/GPSRiderView.jpg
http://www.qsl.net/w5aox/images/APRS/gpsbracket.jpg
http://www.qsl.net/w5aox/images/APRS/GPSsideview.jpg

I just bought another bike, and the bracket on it is a simple straight aluminum strap clamped on the handlebars with a hose clamp. After I give it a few shakeout rides I'll try to remember to post pictures.

I think APRS is the more useful of ham radio functions - especially on a bicycle. I find, when riding, I'm rarely "in the mood" to try to key the radio and talk.... I'm too busy huffing and puffing. The APRS bleeps merrily away, reporting my position, speed, direction, etc, all by itself. I don't have to even look at it, much less talk on it, for it to work usefully. For voice, on the UHF side of my TH-D7, I normally monitor a local repeater or remote base with a modified cell earpiece. If someone says something especially interesting such that I decide I'm wanting to start transmitting, I pull over and take a "Talk Break".
I've chatted a FEW times while in motion.... the QSO mostly consisting of "Yeah, I'm (Puff) really bicycle mobile (Wheeze) - Trying to maintain oxygen here, 73 BYE...,<Gasp>"
I find such bragging rights are not worth the trouble so I mostly monitor instead.

Richard

Tahnks for the input-
If I end up riding in the rain (been there, done it) I will be paying so much attention to the road that the Garmin will very happily be in the trunk bag in a zip lock. I don't think enough of my ability to be able to wipe the rain off my glasses, ride the bik and look at the garmin at that same time HI HI.

So far in battery mode the Garmin has run over 5 hours continuous. Since Beth does most of her runs sub 4:30 that should not be an issue. I hope.

The idea is to keep me from getting lost in a strange city (or a familiar one).

Looks like it is time to get the sheet metal and plasma cutter out :-)

Again thanks for the thoughts, Don't go too far away, I will probably have more questions.

Hi Bruce

At this point I hope I am not out in the rain so much that internal gallon baggies don't work.

I get miserable enough without that thought.

2 weeks on a motorcycle going to Nova Scotia and back to Michigan, with the entire trip in rain gear taught me that I don't like rain.

The panniers will be to hold (at this time) my thermos, a simple (retired paramedic) jump kit and maybe my crossword book.

Got caught in Chicago without a jump kit and don't want to relive that nightmare again. Problem with wearing safety green shirts are that everyone thinks you are a rescuer! Even though the back of the shirt had a real big Miss Geico on the back (Geico Off shore racing).

I agree that the bigger the bag the more stuff. I drive a suburban, want to guess how much "JUNK" is in it?

About the floating - been there done that but not with the bicycle. Dirt bike yes. They don't float BTW. Hi HI

Thanks for the thoughts

Time to figure out what I am going to do.

BTW, the garmin was a suprise chirstmas present, didn't get the chance to pick one out but is is a great one for the car.

Twenty plus years of boat racing and boat racing support (dive medic) not to mention motorcyle touring have taught me the value of a zip lock bag or twelve (hi hi).

They only work however, if you remember to zip the top, Don't ask, it is too ugly to bring up.

Thanks for the input

Beth has gotten into adventure running.

I intend to drive the truck when supporting those. One of her runs
(Dances with Dirt) in Hell, Michigan actually (really) has the runners
going through what is described as a "Bog".

Funny, my survival instructor called something like that QUICKSAND.

Who is more crazy, her or me?

Thanks
Kevin

1609. Newsletter CD mailed to paid BMHA members

Yahoo group: BMHA
Date: 2008-03-18 16:00:05 UTC
From: Mike Nickolaus
Topic: 1609 Message: 1609

As indicated in the BMHA New Directions memo last year, previously paid BMHA members would be mailed a CD containing all past issues of the BMHA Newsletter. This mailing has been completed and previously paid BMHA members since the year 2000 should have received their copy.

If you were a paid member since 2000 and did not receive the CD, please contact me as we know some addresses have changed and we do not have your correct mailing address. For those who have received your CD, please check the mailing label on the mailer and update me with your current email address.

One benefit of being a previously paid member is we will notify you when each new newsletter is published. New dues free members will also be notified. For this benefit you will need to complete the membership on the BMHA web site, www.BMHA-Hams.org

Our thanks to all of the paid membership and we hope you enjoy the newsletter CD.

A special thanks to Skip La Fetra, AA6WK for his efforts in compiling the newsletter CD and making the many copies.

Mike Nickolaus, NF0N for the BMHA Board of Directors

Hello Group - I'm trying to mount a Yaesu VX-7R handheld transceiver on to the handlebars of my Moulton AM7 bicycle. The handlebars are forward facing Profile Design Airwings with Dia-Compe barend brake levers. For safety reasons, I will not be transmitting whilst cycling. However, I do require quick access to the rig when stationery. Does anyone know of a handlebar mount that will meet my needs?

Many Thanks & Best Wishes
Tim

RAM products makes the BC-1 cradle for HTs with belt clips. Always
use a Velcro(tm) strap around the HT and mount for safety's sake.

Look at the photos and part numbers here...

Thanks Clint

I've checked your pictures & your setup looks good. However, I've
just purchased a mount. Hopefully this too will do the job I want.
My only concern is having the PTT triggered accidently. Hopefully
this will not be an issue. But if it is, I'll try packing that side
of the rig with something like cardboard or expanded polystyrene.
I'll post back & let you know how things progress

Best Wishes
Tim

PS ☐ Great pictures by the way!

Nice looking mount.

Now... I see you want it for use with a VX-7R. I'll be interested in seeing your pics when you get it mounted. This is because... as I look at this mount... to me it looks like the pieces on the side "might" be close and in the way of the PTT switch (don't want to accidently key the radio) and the DC-in jack (if you want to run it off of an external power source).

I saved the link and if the PTT and DC-in jack of the VX-7R aren't covered up by the side pieces... I may get 2 of these (one for the VX-7R and one for a GPS). I wonder if my TH-D7A(G) will fit in this holder.

I purchased a mount just like that to mount my cell phone on my
motorcycle. I found I needed a piece of Velcro on the back of the phone
and the mount to keep the phone in place. Make sure you have a backup
retention mode.
Also you may have to remove a bit of the cushion material from the side
clamps if you have any operation buttons on the side of the radio.
Good luck

==========

Mike, I looked at the link .. and I looked at my VX-7r and I'm pretty sure that the only way the side clamp pieces would not cover the PTT and the external power jack is if you raised the VX-7 up so that you clamped on the lower half of the case (by the keypad) instead of the top half of the case.

While this might work it appears to be a less secure way of mounting.

Yeah... I was kind of thinking the same thing as I look at this mount and the VX-7R. Also... another one of my concerns would be the DC power jack on the other side of the radio getting blocked by the side holders. I like to power my HTs on the bike from a home-made battery pack in a bag under the bike seat. Right now I have 3 8-cell AA battery holders from Radio Shack and got 24 AA 2700mAh batteries off and put the 8-cell holders in parallel for 9.6v at 8100mAh (might make the battery pack bigger using 4 or 5 battery holders). Its smaller and lighter than a sealed lead acid battery (and the VX-7R puts out 5w at 7.4v)

Still... such a mount might be good for my GPS III+. RAM makes a nice handlebar mount/... but I think the shortest "extension" between the mount's base and the cradle to hold the GPS is 3 inches. Don't need the GPS to be extended from the handlebars by that much.

So... will have to wait for the other person to get this mount... put it ontheir bike... and put the VX-7R into it and see how it looks.

Nice photos of the ht mount at
http://homepage.mac.com/clintbradford/PhotoAlbum8.html
(http://homepage.mac.com/clintbradford/PhotoAlbum8.html)

But, I don't want to sound picky but having the antenna cable hanging out there in space and with a full size bnc connector & cable is going to put a strain on the radio.. serioursly. There's lots of vibration out there on the road and over time something will get compromised. Plus there is plenty of chance to snag it on something which would yank that ht celan out of holder or bust off the connector, either of which would make for a bad radio day.

I'd suggest making a custom cable from bnc to RG316. I've had great luck with the folks at RF Products making custom cable to go from HT I carry in handle bar bag (speaker mike is only part showing) to go to the 1/2 wave (needs no ground plane) 2m/70cm antenna on the rear rack. The 770 antenna has fold over option which comes in handy when in a crowd to reduce the eye poke potential and when transporting the bike.

Example of cable and a 90 degree SO239 mount for antenna
http://www.rfparts.com/diamond/k601m.html (http://www.rfparts.com/diamond/k601m.html)
(disregard the folding mount part)

Example of antenna _http://www.rfparts.com/diamond/nr770ha.html_
(http://www.rfparts.com/diamond/nr770ha.html)

I can send photos on request. Just look my email address up on QRZ

My HT is mounted very similarly, albeit with homebrew mount, with the BNC and cable looping pretty much the same way. No issues at all in more than a year with ***Lots*** of vibration. My HT/GPS mounts use a strap of aluminum for the support "arm", which allows the aluminum strap to bobble when encountering "vibration areas" in the road. Looks weird when wobbling but saves the electronics in the long run. If we have a "close encounter" that endangers the HT and the coax, the electronics in front of the handlebar will be the least of our problems.

I used a thin foam pad (free from some packing material) and a velcro wrist watch band to hold my HT securely to the handlebar.

I clip the speaker-mic to my collar were it is easy to use while riding if the trail is not too rough. Most of my riding is on bicycle paths or gentle back-country trails not the extreme stuff.

I tried a VOX and earphone, but prefer the speaker-mic

I suppose it would if in fact I would be able to get CQ however in this
small town there isn't one available on the magazine stands

1629. April 2008 CQ Article

Yahoo group: BMHA
Date: 2008-03-27 02:11:38 UTC
From: Mike Nickolaus
Topic: 1629 Message: 1629

Here is a link to the CQ April Issue showing the front page and contents page from that issue:

http://www.cq-amateur-radio.com/Apr08Highlights.html

If you click on the contents page you can view it and expand it for viewing. At the top left of the page you can see a picture of my tricycle which is also in the article. I can't show the actual article as it is copyrighted but for those that do get CQ, the actual article features Budd, W3FF and Wes, AC5K. There is also a nice write-up about BMHA along with a picture of my setup from field day last year. The author, Dave Ingram, K4TWJ, is a longtime supporter of BMHA and has given up some great publicity and has featured Bicycle Mobile in a very positive light. My hat's off to Dave, great job.

Mike, NF0N

1630. Re: Handlebar mount info please...

Yahoo group: BMHA
Date: 2008-03-27 11:13:30 UTC
From: m3kwo
Topic: 1610 Message: 1630

My radio mount arrived yesterday morning after only seven days! Not a bad delivery time from Hong Kong to UK! Total cost to me was 13USD (approx £6.50) Unfortunately as it was raining here yesterday, I wasn't able to properly test the mount. However, I suspect it will require an additional velcro strap to avoid radio damage. For now, what I've done is mount my Yaesu VX-7R in two different places on my AM7 - I prefer the frame mount. What do you think?

Best Wishes

PS - Pictures posted in m3kwo Picture Folder

Congratulations, Mike!

The tricycle picture looks great! I'm going to have to stop over at
Amateur Electronic Supply in Milwaukee soon, and get me a copy...

Hope to catch ya' around the bands someday like we used to back in
the early 90's!

My D-700 is a marvelous radio, but I foresee a few show stoppers for using it on my bicycle in place of the TH-D7 currently running there:

-Size and weight of the radio
-Power drain of the D-700: More than half an amp on receive
-Weight of battery required to run it: See above

I find that my Magellan Meridian Gold GPS runs for several days on its own internal AA X 2 batteries, and only recently discovered it works quite well with Nicads, which really lowers the cost factor for batteries.
The Kenwood TH-D7 isn't much for a dual band HT, but it works very well for me as an APRS bike-mobile. On the internal battery, running in single band mode on APRS, it will last about a week of daily commuting, even set to high power.
The antenna, as always, is the limiting factor for a bicycle-mobile. I've used rubber ducks and full 1/4 wave "stingers" without ground plane (It's a bike, and if the antenna is mounted somewhere close to "Ground", it has to radiate mostly into my back or belly, and there's just not much ground there anyway, even at VHF). Very seldom does the duck or 1/4 wave antenna result in a successful APRS transmission.
Thus I find that homebrew J poles work the best for me. No ground plane required for good performance, they are tall and visual eye-catchers so they both help motorists to spot and avoid you as well as radiate about as well as possible from a bicycle.

I think you can shut down the display and turn a D700 into a barebones rig if that's all you have to put on your bike. Then it won't be a power hog.

I've used a TinyTrak3 and an ancient Radio Shack 2m HT on a motorcycle with a homebrew J-pole for about three years. That radio only sends five-watts to the coax. But I've run out across West Texas from Dallas on US 380 and crossed New Mexico and into Arizona, up to Grand Canyon and back into Las Vegas, New Mexico. You'd be surprised where that small signal fines gateways.

Rechargable batteries will give something less than 12 volts. D dry cells don't cost that much and they'll give you full power on an HT.

Thanks for the antenna info and drawing.

I am not too worried about the weight of the rig and batteries at this point. If I want to trim weight it should come off my fat backside first....

I put together a bike mobile setup using a D-700 2 years ago, mostly because I live in a sparsely populated area and thought the higher power would make a difference. I put a few pictures up in the BMHA site in the photos section.

While it worked, I became worried about the weather, since it is in no way waterproof. I don't know of any way to use the radio "headless," and the whole point for me was to utilize the display while moving anyway. If you want to just use it as a beacon, there are much cheaper, better solutions available. Battery life was bad. I used a 7Ah gell cell, which didn't last as long as I'd hope. There isn't much you can do to lower the power consumption (like turning off the backlight) either, I'm sure because it was designed to be used in a car.

In the end I got much better performance overall by leaving the D700 in the car on digipeater mode and using the D7 with the 1/2 wave antenna (it took up a lot less space in the trunk, too). If you really want/need more power, I would investigate using the Yaesu FTM-10R and a Tiny/open tracker.

It sounds like you have a spare D-700.

If you just want a beacon, however, Byonics makes a nice lightweight
portable APRS beacon, Micro-Trak 8000

http://www.byonics.com/microtrak/mt8000.php

Micro-Trak 8000 is available on either 144.390 MHz or 144.800 MHz,
transmits up to 8 watts

* No need to tie up an expensive radio for APRS tracking
* No complicated radio cabling
* Simple 2 wire GPS connection

Micro-Trak 8000 is a transmitter only. It does not receive radio signals

George

There are few instances when a transmit only unit is "good amateur practice.." Even fewer when using 8 watts.. The Trackers with a real transmit and RECEIVE functionality are a much better idea.

Personally I can't imagine serious BMHA activity without a D7.

The Bayonics and Opentrackers both listen for activity, but cannot decode packet. As ususal, if you have your squelch set too high, this can cause "bad amateur practice" but in reality, I found the Tiny Track III to be a little more sensitive than necessary.

Well, looks like the cq'er contest'ers are hot and heavy on 20M today.
Listened and called CQ on 7.280 for a few min just before 3PM CDT,
20z, and didn't hear anyone.
Got to hit the showers and get ready for a 12 hour shift at the plant.

Maybe next week there won't be so much stuff going on 20M and we can
get a few QSO's going.

I hope in 3-4 weeks it will be warm enough that I can be on the bike
trail on 20M... will have to see what happens with the weather!

Yeh, I was looking for you on 20 and 40, but ended up working a dozen or so in the contest. The new 857d works pretty good. After years on 5 watts or less it's kinda refreshing to get answered on the first call. 17 meters wasn't bad this afternoon, it seems to be propagating well around that time in the afternoon.
I'll likely be looking for someone on 20 next week .
Right after pulling the big switch on the radio, I went out for a bike ride. The weather wasn't optimal, but good enough.

Yahoo group: BMHA
Date: 2008-04-02 18:44:35 UTC
From: N1KHB@aol.com
Topic: 1644 Message: 1644

Hi all,
I've been a ham since '91and have been operating base, mobile, and portable for most of that time. I'm going to attempt a return to bicycling after a 25 year hiatus, and with it of course will go ham radio. I'm used to compromise operating especially with regard to antennas, so HF bicycle ops will probably be similar.
I'm looking forward to learning from those of you with experiences to share.

Joe welcome good to hear your back into biking - I am in process of pulling my bikes out of storage here in Cortez, Colorado now that the sun is peaking out of the clouds more often. Last 2 years with 3 heart attacks, newly developed high blood pressure and diabetes I could not ride more than several blocks without being wiped out and missed the riding severely so. This year I am pulling my 2 road bikes and my recumbent out and am going to ride (though easily) regardless! Of course I will have my ham rigs and cell phone with me so am feeling pretty confident I am going to have a nice year of riding. Hope you have the same 73 Johnny KD5LWU

Greetings all

I have just joined the list as well and am looking
for input on incorporating (most likely) an FT817
on my tadpole recumbent trike. This is similar
to the one I saw in the most recent CQ. Behind
the seat is the obvious place to hide the rig,
battery, etc and afix the antenna to the seat
frame. To get started quickly, I might integrate
my ht somewhere on the frame for now and run
a small antenna off the seat but in the long run
there will be more substantial hardware.

1649. Body-Mounted Radios (was: Old Ham, New Bike)

Yahoo group: BMHA
Date: 2008-04-03 15:09:54 UTC
From: Alan Dove
Topic: 1649 Message: 1649

Hey, folks:

Attaching the radio to your body has a lot of advantages - and some disadvantages. For public service events in the NYC area, which was the context of most of my hamming until a couple of years ago, a body-mounted rig is the only way to go. Besides reducing the risk of theft dramatically, it also ensures that you always have your radio with you. It's also very easy to implement, especially for HTs or a tiny rig like the '817, where you can attach a small antenna directly. If you're not sure whether you want to operate bicycle mobile, this is a good way to test the waters.

Having said all that, a bike-mounted radio is definitely in my plans for this Spring. The antenna can be much bigger and better, external batteries become practical, and it takes the weight off me and puts it on the bike, which I like. I'm still a bit worried about theft, as I use my bicycles for practical transportation rather than pure recreation. If anyone has suggestions on reducing that risk when I park and lock the bike, I'd love to hear them - removable remote heads are a possibility, but some hard-to-hack attachment between radio and bike would be even better.

Finally, I can say from unfortunate experience that you should not, under any circumstances, try to combine these two approaches, i.e. mount part of the radio system on the bike and the rest on your body. I once plugged my belt-clipped HT into a small mobile whip on my bike rack, and everyone at the event I was working agreed that my signal sounded great. That is, until I got off the bike to deliver a message to the event organizer, and ripped the connector right out of the radio.

Hi Mike,

I don't own a "bent," but somewhere I saw a fellow with a bent who
carried his K1 in a pounch on his stomach. When he left the bike he
simply unplugged the wires and the radio went with him.

It looked good to me.

j

I disagree -- but you must PLAN the tear-away or disconnection points.

My most important example is the microphone/earpiece (intra-aural, all is in my ear) which is very carefully strapped to my helmet straps and is ALSO very carefully planned to be fragile enough that if it drops into my front wheel the cable will be "toast" and I won't be !

Plan for things to snag at the worst possible time. Designing the right disconnects can literally save your life. I don't like "plug" disconnects (a magnetic latch similar to recent Apple laptops might be an exception) -- instead I choose a very fragile "sacrifical" cord which I know will break and tear away under an acceptable strain.

Cheers,
- Skip AA6WK

I disagree .. that the *only* way I've ever operated. Radio on my belt, and
the antenna on the bike.

Hey, folks:

I take your point about designing a breakaway system, and perhaps I worded my warning a bit too strongly. Maybe it would be better to say that one shouldn't split the system into bike-mounted and body-mounted parts without giving serious thought to how the components will separate - whether by accident or absent-mindedness. Also, any "breakaway" system that relies on a weak cord will still involve breaking something, which then has to be fixed.

Greetings all

Here is one thought at least for HT's especially
those with sma connectors is to use a pigtail
connector with a press on smb or smc connector.
Ive seen these connectors more especially at
ham fests. One additional bit of 'insurance'
would be to put some heat shrink on the connector
cable interface for a bit of reinforcement.

1654. Q about operation while in motion

Yahoo group: BMHA
Date: 2008-04-03 21:15:58 UTC
From: Dave
Topic: 1654 Message: 1654

I'm a cylclist. I'm a ham. I love both. But...when I'm cycling, I tend to either ride flat and flat-out, or I'm doing hills. I can't imagine huffing and puffing and carrying on a QSO...I surely could not pay proper attention to the QSO and traffic.

I've done CW while mobile...but wondering just how well this works bicycle mobile? Do you end up slowing down and doing the cycling at a much more liesurely pace than normal, so you can concentrate on the QSO, or do you cycle as normal, and only do "lightweight" QSOs?

I'm not much of an FM/repeater guy, although my last bike mobile was exactly that. A public service event: a half-Marathon walk for cancer, and they used two ham cyclists to ride from front to back of the walker pack several times, looking for people who were getting in trouble. But that was a super-flat path along a creek and because of the pedestrian traffic, the cycling speed was quite slow - I put in perhaps 90 miles in the ten hours I was active, which on flat land is just a stroll in the park.

I've got an '817, that plus some telescoping poles allows me to go portable, which I've done. But I did that by cycling up to a ridgetop, then deploying radio and antenna - not actually operating while in motion.

I'd be curious to hear about riding/QSO techniques for CW bicycle mobile.

1655. Bike setup

Yahoo group: BMHA
Date: 2008-04-03 20:45:01 UTC
From: Kelly Gray
Topic: 1655 Message: 1655

Hi everyone,
I just thought I'd jump in with my bike setup. The radio is a Kenwood TH-D7 dual band with TNC. It's mounted on the right handlebar with a mount from RAM mounts. Balancing it on the left handlebar is a GPS unit that provides navigation as well as location information for the APRS beacon.
Power is supplied by a 7AH gell cell in the handlebar bag.
The antenna feedline runs along the frame to the NMO mount located at theend of the rear carrier. the antenna itself is a dual band antenna intended for fibreglass vehicles. It's a half wave on 2m, and stacked 5/8 on 70cm.
I use a headset to talk while I'm riding. the earbud is in the right ear with the cable routed under the helmet straps to help hold it in place. The microphone with the PTT is clipped to the free end of the helmet chin strap. I's considered VOX, but decided against it. Between the highway noise and the occasional 'oh shit!' moment, it's far to easy to make unintentional transmissons that way.

Normally I'll be chatting on 70cm while beaconing on 2m, but I can put both the voice and digital channels on the same band without problems. The effectictive range of the setup is about what I'd get with a 5W transmitter in a car, so I'm happy. Now if only we could get rid of all this white stuff so I could get the bike out again.

Awful things can happen with a VOX. And nothing can be done to change what has occurred.

About fifteen years ago I was waiting for an Army MARS net to start. The person who was assigned net control was evidently tidying his desk when his microphone fell off. We heard the crash and then a blue streak of verbs and adjectives. Even my face turned red. And then everything went silent.

At the top of the hour the net was called and as far as I know this is the first time that incident has ever been mentioned.

And I had a drunk girl hit me while I was riding my bike. Fortunately she only clipped me with her mirror, but I'm sure I made up a few new words to describe her! As far as I know, either nobody else heard me on the radio, or they were polite enough to pretend they didn't! In any case, don't do VOX. Besides, it's either too sensitive and wind noise or passing vehicles trigger it, or it's so insensitive that you have to yell to get it to trigger. Just doesn't work all that well on a bike.

I've done a few "quick exchanges" while in motion bike-mobile, 2 meters and 440. I find it's not worth the trouble to try to do more than "Hi, I'm on the bike, BYE" type of "QSO" just for bragging rights. If I was on some imaginary highway, lots of room all around, no pedestrians or other bikes or vehicles around me for a long distance, I might get more interested. I normally find myself "Too Busy" while in motion, sucking air and watching and dodging surrounding traffic. I enjoy monitoring (I frequent a local 440 remote base that allows monitoring or working frequency agile 2 meters or HF all-mode via the 440 side of the TH-D7) and, if something comes through the earpiece that interests me sufficiently, why, I pull over, take a break, and chat a while. Mostly I just listen while I ride.....

I am very interested in hearing more about your set up. I have and am planning on using the exact same arrangement. Most importantly, I am wondering about your RAM mounting system. I looked there as well for something and then looked again after reading your posting. However I did not find anything that appeared suitable for mounting on my handle bars. Could you please send me a description, product number, web link or something as a reference to what you have found useful?

I have been reluctant to mount my Th-D7 to my handle bars because of the jarring that takes place when I hit even small bumps. I am guessing you do not find that to be a problem?

Thanks for your help,

1662. RE: [BMHA] Q about operation while in motion

Yahoo group: BMHA
Date: 2008-04-03 23:45:45 UTC
From: Ron Baran
Topic: 1654 Message: 1662

Howdy Dave,

I've been playing bike mobile for the last five years and "flat out" and "bike mobile" are mutually exclusive.

Pretty much depends where your heart rate is. My average for a ride of 2 hours or so is around 130-135. For me that's a work out in training range - for others it's not even a good warm up.

I've been sliding down the scale of bikes over the last 25 years; from Cannondale SR500 racing bike to a Miyata road bike, to a Trek 830 mountain bike and finally - oh the shame of it all - a Cannondale comfort bike. I try to bury the description when people ask by saying it's a city bike or hybrid bike - but it's a comfort bike.

I've operated CW from both the Trek and the Cannondale and have even done Field Day on CW on both. Obviously I don't go very fast and I try to stay out of traffic.

When you get old an febrile bike mobile on HF will suddenly sound like a good idea. So a Comfort Bike.

bicycle mobile? Do you end up slowing down and doing the cycling at a

much more liesurely pace than normal, so you can concentrate on the

QSO, or do you cycle as normal, and only do "lightweight" QSOs?

I'm not much of an FM/repeater guy, although my last bike mobile was exactly that. A public service event: a half-Marathon walk for cancer, and they used two ham cyclists to ride from front to back of the walker pack several times, looking for people who were getting in trouble. But that was a super-flat path along a creek and because of the pedestrian traffic, the cycling speed was quite slow - I put in perhaps 90 miles in the ten hours I was active, which on flat land is just a stroll in the park.

I've got an '817, that plus some telescoping poles allows me to go portable, which I've done. But I did that by cycling up to a ridgetop, then deploying radio and antenna - not actually operating while in motion.

I'd be curious to hear about riding/QSO techniques for CW bicycle mobile.

Uh, perhaps I've missed something but I think multi-tasking was
pretty much debunked about 5 years ago as being a pretty goofy notion.

Specifically, as it was written up in several medical journals, it's
impossible.

As far as slowing down, cheez.

Get out there and beat yourself up !

If you'd like, see:

http://www.gobahams.org/BikeMobile.htm

and click on "How to Wire a Bike for Ham Radio."

Go all out.

Ride and play radio !

You only live once.

Ignore anyone who suggests you slow down.

Oh, perhaps you'd like to join us for a week.

Best,

Bill

When cycling, if left to my own devices with no other distractions, I also tend to wind up maxing out. But if I'm riding by myself, and listening to the radio, I will just slow down some if I want to make quick comments. I seldom find I can reasonably hold a conversation while still riding though, unless it happens to be with the wind and/or downhill. Otherwise there's too much "huffing" as I breathe. I'll only subject people I know well to that! :)

If I want to actually get into a conversation and I can't cruise slowly, I'll just stop and take a break while chatting.

I spend most of my radio time listening anyway, and that applies to the bike as well. I don't usually have to fight much traffic or pedestrians where / when I ride, so the radio helps give me something to do besides look at the same cows and horses I saw last time I went that way... :p

I have forgotten enough CW since I last messed with it 15 years ago that I couldn't have any sort of CW QSO right now, but I'm tempted to brush back up on it and try it mobile. It would sure be a lot easier to get a key to work on the bike than find a mic that handles wind noise well! Not to mention getting farther at low power.

Topic: 1654 Message: 1667

I did CW while vehicular mobile. But I'd never make the attempt if traffic were other than super-light. I did my CW mobile only on the interstate, with good WX and smooth traffic flow. One of the more interesting ones was when I drove down I-5 from the bay area to L.A. and one of my QSOs was with a ham in Seattle...who used to cruise that trip a couple times a week. He'd ask me which exit I was near and then ask "Is that trinket store still just off the exit?" It was an interesting journey.

I don't know how multi-tasking is officially designed. We've all heard legends of the guy who could send CW at different speeds with each hand and carry on a conversation in person at the same time. I can make no such claims. However, when I'm typing a document, I tend to form the whole idea of a paragraph in my head before I start to type - then the whole paragraph flows at once, reasonably well-formed and even spelled right. When I'm in that state of typing, I can indeed, carry on a conversation with someone else in the room. People tell me is really quite distressing, to be obviously having a conversation with me, while my fingers (which I'm not looking at) seem to be typing away on their own without my attention or even awareness.

I did not find biking and 2FM a challenge - however, it was surely a flat ride, and the paved path allowed only cyclists and walkers.

My "neighborhood ride" is on country roads - no shoulders at all, 55MPH speed limits, and no matter which direction I go, there's a 500 foot climb in only a few miles.

I expect I would not be able to carry on a QSO while bicycle mobile. In fact, when I think about it, I have a hard time chatting with a fellow cyclist while we're riding together.

So, I suppose what I do now is what I will continue to do...use the bicycle as transportation to take me to a portable spot.

I ride with the D7 as described in the current newsletter. I do long conversations while riding through the local repeaters. I've never tried HF as I would need to lose the 30-60 pounds I'm overweight to allow carrying a decent battery. We nuts who never ride bigger than a 700-23 have to be careful. An over the ear bud with boom mike and the push to talk Velcroed to the top of the handlebar within thumb reach of the break lever lets me control the bike.
I've been riding since the early 70's and rode in DC, New Orleans and Panama (Canal Zone and country). Now riding in central Illinois makes it seem like I am in the middle of nowhere. I'd sure have a bit more trouble in Chicago I guess but I think I would still be on the air.
Many years ago I ran a CB on my bike while commuting in DC.
My handle is Panama Pedaler. Coast to coast in 4 hours!

Subject: [BMHA] Bike setup

Hi everyone,
I just thought I'd jump in with my bike setup. The radio is a Kenwood TH-D7 dual band with TNC. It's mounted on the right handlebar with a mount from RAM mounts. Balancing it on the left handlebar is a GPS unit that provides navigation as well as location information for the APRS beacon. Power is supplied by a 7AH gell cell in the handlebar bag.

.....snip.....

1671. re: Bike Setup

Yahoo group: BMHA
Date: 2008-04-04 22:47:05 UTC
From: Kelly Gray
Topic: 1671 Message: 1671

Hi all,
The mount I'm using for my Th-D7 is the RAM mount here:
http://asp.ram-mount.com/rammount/productdetail.aspx?partnumber=RAM-HOL-KE1U
I took a length of aluminium flat stock, drilled and tapped a couple of holes in it, and bolted it to the mount with the bolt heads on the inside of the mount. I then used a scrap piece of inner tube and a hose clamp to anchor the aluminium to the handlebar. It's survived hundreds of miles of cycling with only minor slipping, and no damage to the radio. This is on everything from city streets to gravel bicycle paths.

I used to use an SMA to BNC adaptor on the radio to connect the RG-58 feedline. I wasn't all that happy about the weight of the cable and the leverage of the adaptor all on that tiny SMA connector. This year I've replaced the feedline with RG-174 with an SMA connector. I'll have to see how that affects the effective range, but I doubt it will change much.

I'm not entirely sure what the battery life is like, I've never managed to run the battery down. It has lasted through two consecutive eight hour days without a recharge, but I have no idea how much longer it might have gone. My habit is to put the battery on the charger as soon as I get home.

To use a GPS with the Kenwood radio, it need to be able to output NEMA sentences at a speed of 4800 BPS. If your GPS supports it, there should be a section in the manual on how to use it.

My riding group are all on recumbent bikes, two and three wheel. We all are set up for 440 with extenal antennas to improve range.

However, one of my buddies also operates 40M CW bike mobile. He rides a 3 wheel delta trike (1 wheel front, two wheel back) and has mounted a key on his steering tube. We can tell when he is in QSO bacause he does slow down some. One advantage to working CW is you aren't huffing and puffing into a mike...

We normally run neighborhood streets and subdivisions with light traffic. Additionally we are FOG's (Fat Old Guys) and are not out to break any speed records, just ride and have a good time. But it is interesting to see some pedestrian reactions when this strange bike passes with a repeater antenna, a 40M antenna, and his bike flag.

John

1674. Re: Lightfoot recumbent cycles

Yahoo group: BMHA

From: John
Topic: 1672 Message: 1674

I don't know anything about the company per say, but I found this quote "Greenway standard-build weight is usually around 56 pounds" in their website.

Considering the price quoted, there are several delta style trikes from quality manufacturers that won't be that heavy. If you have any hills to do, that weight could get you.

In that price range you might want to look at the Greenspeec Aunora, or possibly the HASE (but I don't remember that price). If you have some need for custom modifications (one handed operations, etc.) then the Lightfoot might be the right place.

Best of all, find a dealer(s) with stock (all brands), take a road trip and try them. The cost of the trip is pretty small compared to the purchase price. Besides, that's part of the fun....

Joe,

Bicycle Repair Manual by Chris Sidwells is a concise book that has most of the basics along with pictures of almost everything. Here is the Amazon link:

http://www.amazon.com/Bicycle-Repair-Manual-Chris-Sidwells/dp/0756602955/ref=pd_bbs_2?ie=UTF8&s=books&qid=1207679280&sr=1-2

I see it is out of stock temporarily which must mean it's popular. Cost is about $15.

I agree. While I do use my book a lot sheldonbrown.com is one of the laces I go for clarification. It's a great resource. Sheldon will be missed.

Hi all,
Can any of you recommend one or two book titles for bicycle maintenance?
The basics are fine. I don't expect to be rebuilding derailleurs.

Yeh, he passed suddenly. His health had been deteriorating. He had been battling MS for a couple years. I had the opportunity to spend some time with him on a couple of occasions. While not a ham he had a great appreciation for technical things. He had a great ability to explain bicycle things simply and entertainingly. I wish I could write half as well as he could.
His website will continue. His main employer Harris Cycling has said it will continue. Which is a good Idea since Sheldons website has much to do with this shops success I recon.

1684. Interesting letter to the editor

Yahoo group: BMHA
Date: 2008-04-09 05:30:16 UTC
From: Norm Huber
Topic: 1684 Message: 1684

The Chicago Tribune published the following letter to the editor on April 8:

Mutual Respect, Mutual Safety

Before the bicycling season gets really rolling, it?s time to pedal a healthy dose of perspective.

The millions of Illinois drivers who willingly share the road with bicyclists should be applauded. They safely pass bicyclists on the road with three feet or more of space, which is now the law. They show the utmost respect, follow all the traffic laws and yield the right of way.

Many drivers show their support by smiling and waving as they drive by. They help to make bicycling safe and fun for us all and provide encouragement for others to take up bicycling as well.

These drivers don?t think it necessary to honk their horns, shout ?get off the road,? shake their fists or drive perilously close to bicyclists to intimidate them. They know this behavior can lead to road rage, crashes, injuries or even deaths. Some drivers try to justify their aggressive actions by pointing out that bicyclists flaunt traffic laws, run red lights and stops signs and ride three or more abreast while impeding the reasonable flow of traffic.

There is no argument that some bicyclists do fail to follow traffic laws, which reflects badly on the entire bicycling community. If we want to be accepted on the road by more drivers, then we have to be good citizens on our bikes as well.

Mutual respect means mutual safety.

1685. Dayton Hamvention BMHA Forum Room Change

Yahoo group: BMHA
Date: 2008-04-09 13:53:08 UTC
From: Mike Nickolaus
Topic: 1685 Message: 1685

The forum chairman has informed me of a slight change to our Hamvention BMHA forum. The BMHA forum will be:

0930-1115 Sunday in Room 5

It was originally in Room 2. Please note the change. For those going to the Hamvention, look in the program to find Room 5 and we hope all of you find time to attend.

In addition to our great speaker lineup, there will be several door prizes given out.

1688. boom mic's

Yahoo group: BMHA
Date: 2008-04-20 02:41:33 UTC
From: boomer267432
Topic: 1688 Message: 1688

Everyone what all kinds of boom mic's are there to use? and how do you like the one you use .

1689. Boomer mic's - blue tooth head or ear sets.

Yahoo group: BMHA
Date: 2008-04-20 23:18:40 UTC
From: Arnie Grubbs
Topic: 1689 Message: 1689

Hi to the BMHA group..

Well, I have not tried any of the boom mic's as such, due to the fact that
I fear that they will not work well with a helmet.

I am going to try out a blue tooth ear piece in place of a boom when I get all the parts
gathered up. I don't think I will deal with vox, but instead have a
button or toggle on the handle bar for 'push on' 'push off' keying of what ever
rig you are going to be using.

Heres a link to K7AGE's vid on YouTube.

http://www.youtube.com/watch?v=6ypVUoRVv3U

There are several links on his page for bluetooth boom headsets
and blue tooth interfaces.

I am looking at one of the Jawbone ear sets just for the fact that I think
it will work with a helmet on..

http://www.jawbone.com/

Check out the demo vid with noise canceling. I found one on E-bay for about 1/3
of what the mfg'er was looking to get.

73 - and good riding!

Mine is a generic ear bud with an over the ear hook and boom. It has a fairly long cord and the plug to match my Kenwood D7. It has a push to talk in-line in the cord which I use a double sided Velcro strap to mount the PTT on my handlebar where my thumb can reach. I put my helmet strap over top of it and that stabilizes it making it quite secure.
I am well pleased with it.

Amazon.com has the Jawbone for around $80.

AverySound.com has the custom eargels for about $65.

Incredible combination, I use it in very loud server rooms with no issues at all.

That "sounds good" Gary, hi. I have good hearing but still struggle to hear the audio from my Motorola bluetooth headset. The demos of the noise shield on the Jawbone website make a believer out of me! Even the standard earbud would probably work for most of us.

While Jawbone gets high ratings, K7AGE makes a good point about the mic on this style headset being a long distance from the mouth for good communications audio. It would be great if someone could do a similar "A-B" comparison of transmitted audio quality on a ham rig instead of a phone.

1694. Jawbone blue tooth mic

Yahoo group: BMHA
Date: 2008-04-26 19:56:47 UTC
From: Arnie Grubbs
Topic: 1694 Message: 1694

Hi Group,

Well, I just got my Jawbone headset and charger, and I also have a Jabra a210 interface. Now all I need to do is get a patch cable made up for a radio and I can try it out. I'll have to check radioshack to see if I can find some plugs for my radio.

I have not used a blue tooth system before, so it will be interesting to see if I can figure this out and get it talking!

Yahoo group: BMHA
Date: 2008-05-03 16:56:47 UTC
From: Roger Cox
Topic: 1688 Message: 1695

My boom mic & headset is the Telex Stinger. I love it, however I wish that it wasn't tied to the radio with a cord. My next headset is going to be wireless. I have been using the Stinger on the bike for the annual Lincoln Marathon for about 10 years now. Before that I used a speaker mic on an old Icom 2AT. A friend of mine is selling quite a few Stingers at the local hamfests. He must have picked them up as excess inventory or something, as I think they are going for around $5-$10.

BTW, I will be cycling behind the lead female runner in this year's Lincoln Marathon. Look for WB0DGF-4 on APRS maps Sunday morning May 4 from 7am till about 9:45am. There is a link to the maps at the bottom of my www.wb0dgf.com web site.

I am sorry for the unannouced downtime of the BMHA server at http://www.BMHA-Hams.org We had a bit of malware attack on the server and rather than try to block/mitigate it I have chosen to do the prudent thing and rebuild the server.

I do not believe that any "bad" things have happened, but since I am in the industry I'd rather take the server down and rebuild it from scratch. I am doing this now and it should be back up in the next day or so.

It is much beter to be "safe" than "sorry".

The BMHA server remains down. It is a bit worse than I thought -- the motherboard seems to have forgotten what a hard drive is for.

All data is intact, but my replacement machine (an ultra-nice Vista 64-bit dual core) doesn't run the right software.

I expect to have the hardware replaced late tomorrow and the site back up shortly afterward. No data was lost.

Topic: 1700 Message: 1700

Hi folks, I'm Rick in Indianapolis, N9GSU, and a cyclist. Just found this group.

I've operated bicycle mobile, just with an HT and boom mic, but now I'm wanting to go bicycle APRS and make a better VHF voice setup also. This looks like the group for me!

Thanks for having this group, and I look forward to being a part of it!

You are just in time. Hope to see you at Dayton Sunday morning at the
BMHA forum. I'll be heading through Indianapolis on my way there
Thursday. By the way, for us westerners, have they quit trying to pave
over the town yet?

Well...since you're coming through on 70, you'll be fine! That project is
all done, FINALLY :)

Thanks, all, for the welcome!

I apologize for the hardware failure that took our website offline, as well as the software issues which kept it offline (the new hardware is more modern than the old software understood).

We are not 100% (page counters for example are not updated) but all of the essential stuff is back online.

I will be most interested in hearing how this does for you. I very nearly bought one to use with my FTM-10R, but as I read more reviews of it (as well as most all other noise-canceling models) I found many said that while it did handle most other noise well, it did NOT handle wind noise well - which is, of course, the primary noise problem I have when riding...

I sure did like their demos, though! :) May still get one to use with the cell phone for work...

1706. 6m Sporadic E (Es) Skip Season is Here!

Yahoo group: BMHA
Date: 2008-05-20 01:52:08 UTC
From: Elroy W. Shelley, Jr.
Topic: 1706 Message: 1706

For the next few months it will be the peak season for Sporadic E skip on 6m, (10, 12, and 15 meters too, and possibly even 2m if the skip gets intense enough), and sometime between now and August you'll be able to work 500 miles to 1200 miles on single hop skip, and possibly multi-hop skip if the band is right. Low power works well with this propagation mode and you don't need a big antenna at 50 MHz to pull off some nice VHF DX. I use 2.5 watts SSB from an FT-817 on USB on my Trek 7000.

I check the "50 MHz Propagation Logger" web page often during this season to see if the band is hot in other areas of the country, even if it is not open where I'm at, to get a feel if an Es opening may be likely, at the following web link:

http://dxworld.com/50prop.html <http://dxworld.com/50prop.html>

Here's a couple more links for those wanting to read a little about this form of propagation:

http://home.swbell.net/pjdyer/cq/cq7208a.htm
<http://home.swbell.net/pjdyer/cq/cq7208a.htm>

sporadic-e-es.php
<http://www.electronics-radio.com/articles/ham_radio/amateur-propagation\
/sporadic-e-es.php>

If you happen to like DX'ing the FM Broadcast Band or low TV channels 2 thru 6, you'll most likely catch your share of strong, 1,000 mile plus DX on those bands too when when the bands are hot. No big antennas needed here either. In the past, I've kept an eye on TV channels 2 & 3, which aren't occupied here in the Milwaukee area, with a portable TV with it's internal whip fully extended. When those TV channels start opening up, I get out the bike and start working some 6m DX. Here's a VHF DX'ers web page that I found on the Internet with plenty of interesting recordings of VHF DX:

http://www.geocities.com/kw4rz/DX_FM.html
<http://www.geocities.com/kw4rz/DX_FM.html>

Good luck DX'ing VHF on 6 meters from your bicycle this summer!

1707. Howdy to the group

Yahoo group: BMHA
Date: 2008-05-22 05:04:42 UTC
From: Adam
Topic: 1707 Message: 1707

Howdy all,

I am Adam Lawler WK4P from West Jefferson, NC. I took up cycling in 1988 when I went to buy a mountain bike for commuting and when I mentioned a dream to ride from the mountains to the beach they talked me into a road bike. I became hooked. My first century was the Assault on Mt. Mitchell. I made the trip to the beach and one from NC to ON.

My ham radio career began in March 1992 when my "no code tech" license and my first call, KD4MCA. I got my General in 1993 and my Advanced in 1994. After being off the air for about 4 years I got involved in radio again and earned my Extra in 2004.

When I got back on the air the contesting bug hit me and I was hooked again. I have won 2 PSK DeathMatches (2005, 2007), the 2006 VA limited category in the September VHF contest from our portible operating location on Whitetop Mountain (5500 ft) and several other plaques and certificates from my half acre of hillbilly heaven. I changed my call to WK4P in March 2006, 14 years to the day after KD4MCA was issued. It was available and just too close to WKRP to pass up.

My time off the air cooresponded with time away from the bike. My eyesight began to deteriorate due to diabetic retinopathy and I quit riding. My weight ballooned. But in October 2006 my friend KI4DUR and myself were talking on the radio about things we used to do and the dream to ride to CA came back to life. I could no longer see enough to tour on a single bike but when I mentioned my desire to tour with my wife Karen, KD4UKT she said that she wanted to go too. So we found our tandem, a 2001 or 02 Trek T1000 we named Clyde and she became the captain and I the stoker. As we outfitted the tandem to tour I put a seatpack under her seat to hold the VX7r and fastened a metal plate off the back of the back rack to hold the hersey kiss mag mount. We trained and took our first tandem tour, a 400 mile trip from our home in West Jefferson NC to Emerald Isle NC in July 2007. Ham radio played a vital part in that tour. You can read about it on Crazy Guy on a Bike, http://www.crazyguyonabike.com/doc/?o=3Tzut&doc_id=2796&v=3t&term=Adam%20Lawler&context=all

One reason I am joining this group is to learn more about HF instalations on bikes. I found out on May 1st that I am now legally blind and so may actually have time to take the ride to CA I have always dreamed of. If I do I want HF capabilities on the bike. Nice thing about the tandem is I can operate all day, as long as it's flat that is, hard to talk on the hills.

I'm looking forward to being a part of this group and hope to learn and to offer my experiences for others.

Peace and 73
Adam WK4P

1708. Wind-noise with SPM-400A?

Yahoo group: BMHA
Date: 2008-05-29 18:51:50 UTC
From: William Eric McFadden
Topic: 1708 Message: 1708

I've read good things about the SPM-400A mini-boom headset, on this forum and elsewhere, so I bought one to use on my bike with a third-party handlebar-mount PTT button. (The PTT button was a buck at Dayton this year--I bought six!)

Unfortunately, the microphone is picking up so much wind-noise that my transmitted signal is unintelligible. I've already tried adding a small foam wind-screen from another boom-mic but this didn't help much.

What have others done to reduce this wind-noise with this headset?

tnx, es 73.

William

Hello,

The name here is Bryan from Kalamazoo, Michigan.

I just purchased a bike and plan to do Ham Radio mobile. I found the yahoo group via a web search at yahoo.com .

I already own several mobile 2meter rigs so I will likely figure out someway to use existing equipment. Im probably more curious about how others have chose to do antennas etc.

With my Bike I did purchase a rear mounted rack, I hope to attach an antenna there.

well hello for now!

Welcome Bryan,

It's nice to have you in the group.

I run just VHF and UHF, but as you read the mail you find some folks are heavy into HF. The file section will give you many pointers and a host of ideas for what might work for you.

A J-Pole antenna is probably best suited for bikes, but I've had pretty good luck with a modified 5/8 wave by grounding the shield to a bottle cage bolt. I've built several J-Poles from tv lead and shoved them into a section of pvc. A decoupling loop at the base will settle the SWRs down.

Keep us posted with your progress.

1712. Re: {Disarmed} [BMHA] Hello to the Group from KC8HPS

Yahoo group: BMHA
Date: 2008-06-09 12:47:29 UTC
From: Kelly Gray
Topic: 1709 Message: 1712

Hi Bryan,
Welcome to the group.
I do almost all of my operating on VHF and UHF while bicycle mobile. I did a bicycle camping trip recently, and posted a photo of the bike here:
http://img.geocaching.com/track/3a00b40b-859a-4558-9fb5-0a06d18116ad.jpg

The antenna on the rear is a Tram 1180. Low power dual band antenna on an NMO mount. The mount is bolted to the rear of the carrier. The feedline is about six feet of RG-174 running up the frame of the bike to the radio on the handlebars.
Mounted on the left handlebar is a GPS unit feeding over to the Kenwood TH-D7 radio on the right handlebar. All the equipment is powered off a 12V 7AH gell cell battery hidden inside the handlebar bag.

If you've already got a 2m mobile rig, you might be able to fit it inside the handlebar bag. One thing you have to keep in mind is that sooner or later you will get caught in the rain, and you've got to have some means of protecting the radio equipment. In my case, I make sure there's always enough room inside the handlebar bag to allow me to stuff the radio inside it. the headset I use is long enough that I can still operate the radio. I just have to remember to lock the keypad before stuffing it away.

Okay Thanks the repeaters cover the whole area...In a few weeks we will be moving the system (all repeaters) up to the top of Menefe Mountain which will put the system 9,300 feet up and will cover from Farmington New, Mexico to Durango and Pegosa Springs, Colorado to Monticello, Utah to a Portion of Arizona and of course the 4 corners area of Cortez, Colorado and Mesa Verde National Park and can be accessed from all the major highways in and out of Cortez. Currently the system covers about 75 miles in all directions except Towards Durango (that direction goes about 40 miles at present) because of a mountain blocking Durango....that will change when we get it on Menefe. 73 Fr. Johnny pulling my Rans Rocket bent out for summer riding.

1717. BMHA Jerseys

Yahoo group: BMHA
Date: 2008-06-19 20:50:17 UTC
From: Norm Huber
Topic: 1717 Message: 1717

Just a thought. I know that when I wear the polo with the Motorcycling Amateur Radio Club logo, I am often questioned about the group. Perhaps the artists in the group might come up with a design that would generate interest in the group if we were at a hamfest or out in a group etc. I received the address of this particular clothing manufacturer and thought of our group.

A good thought - it might help explain the funny "flag holder" on the back of my recumbent!

Here's another potential source:

http://www.champ-sys.com/index.asp?initpage=Custom%20Cycling

$45 each for custom jerseys, unlimited colors.

I would be interested in a BMHA Jersey, but (this is a big but) only if the jersey
dose NOT have pockets or any extra add-on's to the back side. As a recumbent rider, I just don't want anything on the back side rubbing on the seat back.

Just an old bent rider's rants.

I'd be more in favor of embroidered patches that could be sewn or hot glued to any article of clothing per the wearer's choice - jacket, shirt, sweatshirt, etc. They're a lot cheaper, and far more versatile.

Because a bike jersey is designed to wick away the sweat and dry quickly not soak it up and if you stand in the shower with your jersey and proper bike shorts on that do the same you can then hang them up and they are ready to go the next day. Very useful and very handy on long multi-day trips.

I on the other hand would be interested in a Jersey only if it is a full featured jersey. My rescue inhaler is in the rear pocket so it's handy when drafting along in the pack. I do see the use of a polo shirt, T shirt or good sized patch as an alternative for other venues. Obviously we need a choice just as we need different sizes as well as the possibility of men's/lady's styles.
It looks like it would be a good time to move to full logo design. I presume we want to incorporate the official logo, what do we want to add to explain/identify the group and how might we incorporate call signs and/or handle?

When we did our radio club T-shirts a few years back we took paid orders ahead of time and gave folks a choice in pocket (a front pocket on the Ts) or not. It seemed to work out well and everyone got what they wanted.

If I get one my XYL, KD4UKT, who is my tandem captain will have to have one too so a lady's style is a must.

That's an advantage of an embroidered patch. It can have a companion call sign patch to go with it. I'd be surprised if the better patch makers can't handle that sort of order. And the set can be placed on whatever article of clothing the wearer wants. I know that there some ardent biyclists out there who like the idea of an official biycling style jersey I guess they call them, but for the broad cross section of ordinary cyclers, I think that the patch idea is best. Much easier to stock them too, if they are to be ordered ahead by some central party. No sizes to worry about either.

Hi,

I've been experimenting with different J-poles for two-meters. A friend, the local antenna guru, WA5SWD, fabricated a new J using copper wire, coax shield, a bike flag mast and a carpenter's level. I first became aware of his antenna when he challenged me that his antenna was better than mine. So, when we met at the North Texas HamCom this past weekend I was prepared for a High Noon Shootout. Instead, he gave his antenna to me.

Naturally, I checked the SWR before I set out on my initial road test, and I thought my meter had taken a hike while I wasn't looking. Not! There were no reflected waves. And after numerous signal reports I've determined that his antenna is indeeed better.

In the coming days I'll upload a photo of it.

The increased cost of fuel has caused me to put more miles on the bike then on the car. That makes me a greener person.

Patches are easier but to be honest I don't like the patch idea. A patch doesn't work on a jersey at all, really doesn't work well on a T-shirt either (you'd jest have to see my T-shirt at the end of a long ride).

If someone gets a design and takes an order there is no reason a jersey and a T could not be done. The jersey allows for rear pockets, the T doesn't. An order would simply look as follows:

1 jersey, male, XL
1 jersey, female, M
1 T-shirt, XL
1 T-shirt M

End of order, simple enough even I can do it. Both the jerseys and T-shirts could be printed at once saving the printer time and a setup fee. The only downside would be that all orders would have to be preordered and probably only done once a year. Let the club make a little money, say $5.00 a shirt and you have a fundraiser too.

Peace and 73

Ed,

If you already have some 300 ohm twin lead I would suggest you
carefully follow these directions.

http://www.fiu.edu/orgs/w4ehw/Jpoleant.pdf

Paying close attention to details are very important.

When attaching the coax be sure to remove enough insulationb so you
can get a secure solder job, then slip a piece of shrink tubing down
over the twin lead in order to provide a strong physical connection.

Slip the antenna into a length of 1/2 inch pvc, put a cap over the
top and find a way to secure it to your bike.

Sometimes when you move the antenna the SWRs change from where you
thought they were. I've found I can calm them down by using a
decoupler--four-turns of coax making a five-inch loop as close to the
coax/antenna connection as possible.

Let me know if I've not been clear enough.

72 de Scott/n7net/bm

++++++++++++++++++

If you're more interested in the antenna mentioned below I'll need a
few more days to aquaint myself with it.

Has anyone considered Cafepress? They have gotten *much* better in the quality of thier work of late. The plus is that you order items for yourself, not it a bulk order. Someone would have to set up a store and create the items .. but it's a viable option.

1735. The copper wire/coax shield j-pole

Yahoo group: BMHA
Date: 2008-06-21 20:20:31 UTC
From: Scott Laughlin
Topic: 1735 Message: 1735

Hi,

Here's the measurements I found on the copper wire/coax J-pole.

A carpenter's level was used because that's what he had and the form fit the need. It measures 24" X 2-1/4" X 15/16". I imagine anything close to that size would work.

The tuning stub is 17-7/16" before taking a 90 degree bend and extending another 1-1/8".

Leaving a 1/4" gap, the long side of the J begins, duplicating the 1-1/8" before taking a 90 degree bend before paralleling the stub. It measures 16-3/4, following a bike flag mast that has been glued to the other side of the level.

A length of braided shielding removed from RG-58 is fitted over flag mast for a distance of 35-3/4" and soldered it to the end of the copper wire.

After tuning the braid is covered with shrink tubing.

No doubt there will be variations. There always is.

Let me know.

Does anyone have experience with the Iron On transfer method with the wicking material they make good jerseys of? I am not interested in jerseys or shirts for cheapness. I've had the ride jerseys that would last one or two days of the ride and be a worthless rag. They weren't even soft enough to polish the bike.

As I said, perhaps it is time for the artists to come up with a full featured logo with club name, contact etc. that we could get the JPEG etc for and work from. Also pick an official background color. Two of the groups I belong to incorporated the web site address of the group into the logo so people who saw the logo could get more info on the group. That was mostly for the stickers we have for windshields etc.

1739. Handle bar antenna mount

Yahoo group: BMHA
Date: 2008-06-25 00:10:32 UTC
From: Jeff Newton
Topic: 1739 Message: 1739

Folks, I'm looking to make a handlebar antenna mount for my Icom T-90A dual band ht. And I was wondering what type of antenna's are most of you using for a handle bar mount or even a j-pole suited antenna along the top tube of the bike itself, rather than having one taped to a flag pole or one configured to an nmo mount on a blackburn luggage rack?

I'm actually looking for links of those that have done this. Thanks!

Jeff,

I've tried antennas mounted on the handbar and on pannier racks on front wheels. They don't work for me because they influence the handling too much. I would mount the antenna on the frame somehow.

Google BuxCom for some ideas on pruning a J-Pole that will resonate for both 144 and 440.

1744. Handle bar antenna mount (NOT!!!!)

Yahoo group: BMHA
Date: 2008-06-25 23:15:25 UTC
From: richjkuster@aol.com
Topic: 1739 Message: 1744

All,

????? A 1/2 wave on a rack over the rear wheel IS THE ONLY WAY TO GO!

?????? The Diamond 770 models are the sweetest, esp the ones with the fold over option as they are REALLY handy when tranporting bike over short distance on?a rack (for long haul it is best to remove the antenna entirely) or for when riding into a busy town with lots of foot traffic to make sure?no one?gets their eye poked out like on Ragbrai (hihi)

????? Then some real small coax to the?HT and a speaker mic.? What else would one need?

????? Photos available on request.

73's de Rich AF1K

Subject: [BMHA] Handle bar antenna mount

Folks, I'm looking to make a handlebar antenna mount for my Icom T-90A
dual band ht. And I was wondering what type of antenna's are most of
you using for a handle bar mount or even a j-pole suited antenna along
the top tube of the bike itself, rather than having one taped to a flag
pole or one configured to an nmo mount on a blackburn luggage rack?

I'm actually looking for links of those that have done this. Thanks!

73's -

Jeff

Jeff (and all):
A description of my antenna can be found at
http://75.60.24.163/BMHA/Newsletter/images/V14N01p05.jpg

Photos are included in the article at
http://www.lafetra.com/skip/aa6wk/Articles/CQ-VHF/April-1998.htm

It is an antenna-and-radio-friendly design, although it is not specifically a "handlebar mount". I have used it with 1/2-wave 2-meter "hotrod" antennas with quite a bit of success.

Well, Hi to you too. I am also a new ham, only been on the air since
1963. More details at http://www.qsl.net/w5aox/
A few more details about YOU would be nice too.
I commute regularly by bicycle with a Kenwood TH-D7 running APRS and
(very occasionally) voice with a homebrew J pole:
http://aprs.fi/?call=W5AOX-4&mt=m&z=16&timerange=21600
Unfortunately I haven't been on the bike since last Saturday due to
extreme shoulder and upper arm pain (you may surmise I'm an old phart)
that seems to be aggravated or caused by riding my old no-shock-system
upright bikes. Seriously contemplating building a recumbent bike or
trike (don't see how I could ever afford to pay more for a bike than my
used cars have cost).

Hi BJ,

You'll find this is a friendly group. More knowledge and experience resides here than you can shake a stick at.

We'd like to know your call and location. If you already have a bicycle, what kind is it? Any firm bike/radio plans yet?

I do only 2 meters mobile at this time, using a Cannondale and a Bike Friday. My HF is portable more than mobile. Saturday, I plan to tow a bike trailer to a Field Day site and do some QRP. The trailer is necessary because that's where my 20-meter stick is mounted. There's liable to be so much RF around there I won't be able to get a weak signal through it. But who knows?

Hi,

As stated by someone else, the Diamond 770 series is a popular dual-band antenna with a foldover whip that makes it very nice. I have a setup using this antenna (which requires no counterpoise) mounted on my rear bike rack. With 5 watts, I've been able to work my friend's 440 repeater on the island of Maui from Oahu (over 110 miles), though his 20-watt repeater is atop 10,000 foot Mt. Haleakala!

I'm using a 12V SLA battery and speaker mike; works fine. You can see a photo of the bike (cheap Huffy, sorry) on my info page on qrz.com.

Aloha & 73!

Seems to always be some VHF CW during the contests. During one 2 meter sprint I had a small pileup on CW. Usually there's lots of CW on 6 when Es occurs.

I haven't ever tried it on a bike though.

1757. Tricycle Mobile trip across Nebraska

Yahoo group: BMHA
Date: 2008-07-02 15:43:24 UTC
From: Mike Nickolaus
Topic: 1757 Message: 1757

Starting July 3rd, KA0NCR and myself will be riding bicycle, actually tricycle both pulling Burley trailers, across Nebraska following Highway 20. We will start at the Nebraska/Wyoming border and ride east. Our plans are to operate 20 SSB and CW bicycle mobile and PSK on 20 as a portable station. We will be running 4-5 watt's using a KX1 and ICOM 703. On 20 meters, PSK will be on or near 14.070, SSB and CW will be on the County Hunter frequencies, 14.336 SSB and 14.056.5 CW. I will sign NF0N/BM on SSB and CW when operating as bicycle mobile. This is our planned County schedule for the trip: July 3, Sioux and Dawes; July 4, Dawes and Sheridan; July 5, Sheridan and Cherry; July 6, Cherry; July 7, Cherry and Brown; July 8, Brown, Rock and Holt; July 9, Holt, Antelope and Pierce; July 10, Pierce, Cedar, Dixon and Dakota. These are approximate dates depending on wind direction, weather and our riding capability. I will be using a KX1 on CW with a Buddistick mounted on a Burley trailer and can operate while riding although I will most likely be stationary while operating. This setup does qualify as a bicycle mobile setup as I can ride with all of it. We are carrying 2 seven amp hour batteries. Our PSK setup will use the NUE-PSK unit with a small keyboard. This does not require a computer to run PSK as the NUE-PSK is self-contained. Since we are running QRP, we may operate several times a day and try to run when band conditions are good. If possible, we will run other bands if conditions are favorable, on usual PSK frequencies, CW on 10.122.5 and 7.056.5. Look for us in the late afternoon or early evening after we stop for the night. If you work us and would like a picture of our setup, please request a picture with your SASE and card.

Go Mikey go!!!
With my new found freedom, I've been riding about 10 miles a day in the mornings, then doing work around the house. I've also been looking for a job - McDonalds had open interviews last week (haha). Unfortunately, the market is real thin right now, so I have only been applying for one or two a week. That really sucks!!!!!
I have also been working in my utility room. I have a desk that I put a PC on as well as my 570 so I can get up on HF. I think that the best thing right now is to set up my Tarheel outside and use it for the time being - I need to buy some power cable and figure out how to mount it . I also need to break out my old controller - or buy a turbotuner.
I still want to spend a little time on RAGBRAI this year (time permitting, or course).
We'll stay in touch on this.
 "Every man is free to rise as far as he's able or willing, but the degree to which he thinks determines the degree to which he'll rise" - Ayn Rand

Hi Larry,

It's nice to meet you. I'm also 70 and a short ways north of you in Allen. I usually ride every morning and try to be finished by sunrise. I don't always take my radio along.

There are a nest of we bicycle mobilers here in North Texas. Welcome to the group. I hear there is strength in numbers.

From: tobymarkowitz
Topic: 1763 Message: 1764

I noticed this, too, so searched the internet a few years ago and found nothing. Do rider support vehicles remain within line of sight? For example, a break of 15 minutes, at 25 mph, corresponds to a distance of about 6 miles which can easily be out of VHF radio range.

Might a repeater be used from the helicopter that accompanies the race? Radios are worn under jerseys resulting in a boxy bulge on their backs.

I haven't seen what you've mentioned, but they might be using cell phone frequencies. That would reduce the antenna size.

The team that started with the radios was the Motorola Team. Motorola built those radios. I don't know who is building the radios now. Only a few of the riders on each team can talk back to the team cars. All of the rest of the team have receivers only. The original radios weighed about 1 oz. I think the frequency was around 150 MHz. Damon KB0QCN

I have been watching the Tour De France Race and noticed that most
riders are using radios to recive information from the race organisers
and there teams.
Does any one know what type of equipment the riders are using?

I remember seeing an Alanco DJ-C5 in a documentary about Lance and USPS years ago. I wasn't sure how the bands might overlap between the US and France, or if Alanco modified them for racing use, but I'm sure that's what they were using (I have one and would recognize it anywhere). Thanks for clearing that up, although I wonder how they get/got away with using the ham bands for very commercial use?

Howdy I'm Jerry - NR5A in Box Elder, near Rapid City, SD. I just got a Sunbike EZ-3 recumbant trike today, I actually get it tomorrow.

Of course one thing I want to do is mount my radio on it. I need ideas, sugguestions on putting a radio on a trike. Choice of radio's either a IC-706 or a IC-703+.

I have a Buddystik antenna system, 20, 17, &10m Hamsticks. Please give me some ideas oh where to mount on a trike, and what antenna??

Batteries, how big do I need? and where and how do you mount it????

www.sunbicycles.com is where you can see a picture. Its either a EZ-3AX or SX I don't know for sure right now. I just know I'm really excited about it.

Hi Jerry and welcome to BMHA YahooGroups. You may remember me from
County Hunting.

It seems like Budd, W3FF, the maker of Buddipole and Buddistick has a
similiar trike. Take a look at this site which has some pictures of his
trike with Buddistick. Not sure how he mounts the radio and battery but
this might give you some ideas. I am sure Budd would be happy to show
you more about how he has it setup.

I've always liked the Diamond mobile antennas with NMO mounts. Though I have reservations about the NMO design in general, there really isn't any other viable game in town. Anyhoo, I'd consider using the Diamonds after the good results I've had on vehicles.

I use a hershey kiss mag mount on the tandem. Most come with a small run of RG-174 attached. I mounted a small, thin, steel plate off the back of the rack so I can still keep a trunk on the rack. If you use the rack itself you will have to put a thin steel base to hold the magnet. All in all it's really simple, lightweight, and works pretty well. And comes off easily if transporting the bike or if I want to use the antenna if riding in a car with a non-ham. I think you can see it behind the trunk on one of the pics on this page.

http://www.crazyguyonabike.com/doc/page/?o=3Tzut&page_id=58931&v=20

It works pretty well for me. Hope this helps.

There is no free lunch when it comes to reducing the physical size of an antenna. Somewhere in the details the price is being paid.

My experience with magmounts and bikes has not been favorable. There is simply not enough ground plane and SWRs remain too high. However, by connecting the coax shield to the bike frame the SWR can be reduced.

SWRs can be a thing of the past by fabricating a twin lead J-Pole. They require no ground plane. Therefore, the lack of enough flat area at the base is not an issue. Placing a decoupling coil near the antenna feed point helps.

I think my 6 foot fiberglass "Bike flag pole J poles" are the best small antenna for a bike. Cheap and not difficult to make, and if you make it for 2 meters it will also have a usable VSWR at 440, although admittedly a poorer radiating pattern. I use mine on both bands... when mobile I'm more interested in setting the TH-D7 to single band use on 144.39 APRS, so I can concentrate on pedaling and sucking air. Sometimes I'll monitor the local remote base or 440 repeater on Band B, and if I decide some comment or conversation is compelling enough for me to chime in, I normally pull over and do a breathing-break in conjunction with a short QSO.

> How small is "small"?
>
The above 2 statements best illustrate the problem with all antennas, there are no "best" antennas. If there were we all would be using them. However there are antennas that work "best" for each of our needs.

I like to say that all antennas are a compromise. Some work better than others in some applications, some are more physically practical, etc. That's why experimentation and finding out what works for your application is always the best way to go. Getting all the info you can from others and applying it to your situation helps in this process.

As far as a mag mount and ground plane size, no a bike will never give the ground plane of a car roof. But with the 6", thin steel plate I added on the back of the rack (simple 1 hole drill and 1 bolt and nut) the SWR is satisfactory. And best of all it works pretty well, it has actually surprised me.

I've not tried HF/BM yet. I'm sure those challenges are going to prove more difficult than V/UHF setups. I'm trying to figure out how to mount my A3S on the bike :-)

I use a 10 ft. Black Widow fishing pole that
is 3 ft extending to 10 ft with a 2 meter
twinlead J-Pole. Pretty tough and the antenna
is up high enough that comms is easy. Only
drawback is low hanging trees.

For HF, I have used the same 10 pole with a
wire radiator and a base loading coil. On
20 meters and up it is ok, not great, but
a dragging radial is the only way it works
well. Thought about using a 1/2WL vertical
for 15 meters, etc, and that would eliminate
the radial. Truth is I do not work much HF
on the pedals. I stop and just operate with
a wire tossed up in a tree and get a break
from the pedals.

I know I had sent an email about my plan for this taking this trip some time ago but if you go to my website

www.jarosh.org

you will see pictures of my current bike with which I just finished a 1360 mile ride around Lake Superior with the 1/2 wave VHF NMO mount antenna on the back of an anveir rack. The included hole for the reflector is in the correct spot for the NMO drill bit. I have sunlite panniers and front pack. The 1/2 wave requires no ground plane and therefore is better than a 5/8 plus the 1/2 wave will handle uhf within useable parameters. You can read my daily journals about my adventure and there are some picture.

You can also see my old bike in the Files section of the yahoo news group.

Earl,

Your trip around Lake Superior must have been a daily rush. I've been to Duluth a number of times and then on to Two Harbors beyond there a few miles. The wind off the lake must have been a daily test of your grit, but a signal launched across that much water is no doubt something we'd all be interested in knowing more about.

My J-Pole fits inside a piece of 1" pvc. It took a lot of fiddling to get the SWRs flat, but the decoupler seemed to do the trick. I don't like it wagging around, but it is stout enough to survive low hanging tree limbs that you mentioned.

Mr Boomer,

Not sure whether you are talking about my website or the Yahoo Groups

For the old bike (31 year old Fuji) go to the Files section and find N0HZ. There will be a discussion text and several pictures. For my website and new bike (24 year old Miyata) scroll down to "Click Here for Earls Journals" and you will see the daily journals with picture 1, picture 2, etc links under each day. If you look hard you will see the maxrad antenna on the back of the bike. I took the radio mainly for Emergency and weather reports as the areas between Thunder Bay and Sault St Marie are cellular black holes. I did not do a lot of hamming but got a lot of questions about the antenna and Ham radio.

From: W1RO@aol.com
Topic: 1786 Message: 1786

Don't know for your individual situation, taste, expense account...etc

I use the 18 inch dual band antenna that used to be part of a mag mount set up. This is the one with the 3 inch diameter mag. Since the antenna has a 3/8 24 thread into the mag I simple put a matching mirror mount on my bike rack. I can hit a dozen repeaters in the Las Vegas, NV area with it. When commuting around the bus lanes I give up 440 Mhz and switch to the 80 inch 2 meter Hustler collinear, it uses the same mount. Swinging the 80 antenna make the bus move to the other lane and give me some room.

I see you have lots of ideas on the board so best of luck.

Richard,

The J-Pole is outside the pole, using
black electrical tape at three places.

From: S. Earl Jarosh
Topic: 1771 Message: 1788

Scott,

Yes, the first day a big nor'easter came down the lake and so we had head winds of steady 25mph with 30-35mph gusts. Second day I busted a spoke. Third day we made it into Canada and that was the beginning of the hills and easterly winds. We had picked the clockwise route so that we could catch the Canadian westerly's but as luck would have it, it was a screwy weather year in Canadian too. We woke up to temps in the high 40's and low 50's, so often we started later in the morning. I did not do a lot of radio as I brought the radio mainly for weather reports and emergency but when we camped at Pancake Bay Provincial Park I was picking up 162.55 from Duluth. That is about 50 miles north of Sault St. Marie which is the opposite end of the lake from Duluth. My full journals and pictures on the trip can again be found at www.jarosh.org scroll down and click on the Read the journals link. pictures are linked as picture 1, 2, 3 etc under each day's journal.

I also belong to the NLRS (Northern Lights Radio Society) www.nlrs.org. We have done a lot across the lake over the years. Most of the recent stuff is at 10 Ghz ssb. You can go to that website, noodle around and you will find all kinds of information and pictures on our actives past and present. It is a very active group in the world above HF.

I have used jpoles for many years made in various forms. My first one when I first got into ham radio was made out of scrap 10 gauge electrical wire stapled to a pine 1x4. I have several made out of scrap copper pipe, but my favorite is the backpacking one that I roll up made of twin lead which I hang from trees when camping.

cheers
Earl N0HZ

Subject: [BMHA] Re: small antenna - Le Tour de Lac Superior

Earl,

Your trip around Lake Superior must have been a daily rush. I've been to Duluth a number of times and then on to Two Harbors beyond there a few miles. The wind off the lake must have been a daily test of your grit, but a signal launched across that much water is no doubt something we'd all be interested in knowing more about.

My J-Pole fits inside a piece of 1" pvc. It took a lot of fiddling to get the SWRs flat, but the decoupler seemed to do the trick. I don't like it wagging around, but it is stout enough to survive low hanging tree limbs that you mentioned.

Hi Earl,

Thanks for the great update. I'll go through your journals later today.

You may already know about a roster for motorists who circle the lake by auto. I would think you should be on a separate roster after what you've accomplished.

J-poles seem to be the antenna choice for 2m cyclists.

Scott,

Yes, I know about the Circle Tour roster where they post people's stories and list them. I plan to send them my story. Is there another?

Yes, it does seem like Jpoles are popular with cyclists but they are just a 1/2 wave and a bit cumbersome. so I mount NMO mounts on my racks and then use 1/2wave Larson style antennas. More durable, less mass and less weight. Some time in a couple of weeks after I get back from my Bluegrass Festival, www.minnesotabluegrass.org , I will post new pictures of my bike in the N0HZ files section.

Cheers

Earl N0HZ

HI Mike

You might want to look at a company called Ram Mount, WWW.RamMount.com

I use their HT mount with my Yaesu FT 60 and I use one of their mounts for my Garmin NUVI 200W. They have a huge selection of mounts for Garmins including the newest ones.

Make sure whatever you use that all cables are secured and if they are attached to you make sure they are break away. Really bad show to fall over in front of the local dairy queen (been there, done that).

One of these days I will get around to posting some pics, right after someone tells me how, hi hi.

Ride safe and have fun

1796. Rolling and talking on Saturday

Yahoo group: BMHA
Date: 2008-08-16 00:10:03 UTC
From: bbqhamtrike
Topic: 1796 Message: 1796

Hello to all - Skip, Mike and everyone else out here,
Long time since I've said hello.

I have been trying to get my HF tricycle mobile station going again and today was able to have a very low SWR on 20 meters while using a vertical Buddistick and for the first time no dragging radial! (I have two braided groundstraps, one from the trike frame to the radio). However, I wasn't able to make any QSOs as not many stations on this afternoon. So I am going to be on the air tomorrow on 20 meters during the North American QSO Party SSB contest. Operating here will let me know if I have enough grounding going on and stations can really hear me or if I am faint and need a dragging counterpoise.

So from 18:00GMT to 20:00 point your antennas towards San Francisco and maybe I can have QSOs with some of you. I am not running more than 40 watts so I won't be calling CQ usually down in the busy part of the band but off and on I will be going up to 14.342.50 - (the HFpack Portable Ops calling frequency) and calling CQ up there. I may also try calling CQ at 14.270 if it isn't busy as Buddipole ops call CQ there once in awhile.

Have a good weekend and I hope to chat with some of you from the recumbent BBQ HPV (Human Powered Vehicle).]

I started using my 3 wire setup from KawaCom for my VX160 on my FT 60 and it works fine. Can't speak for the VX 7R but I am willing to bet it will work.

Just ordered a set with a seperate finger PTT, it will work fine on the handlebar but I have not had a chance to try it yet.

Let you know what happens with it.

Enjoying the summer in Michigan

VERY different connectors - physically. Electrically the same, but the waterPROOF radios (VX-
6, VX-7) use a completely different housing than the FT-60 and other similar radios.

The plugs are NOT interchangeable.

Personally I don't see the problem but lots of folks seem too. I for one do not ride on the road, bike trails or sidewalks. I am in the process of putting a IC-706 on my trike. Here is how I'm going to get around the hearing problem. My LBS has a helmet that has surround sound built in it. I ordered one of them. It allows to you have both ears clear, yet hear both the radio and what ever.

1805. SMA-to-BNC Adapters that PROTECT your HT

Yahoo group: BMHA
Date: 2008-08-24 19:59:26 UTC
From: Clint Bradford
Topic: 1805 Message: 1805

For those working the sats with the Arrow antenna...or anyone wanting to attach a BNC cable/device to their SMA connectors...

Yaesu's CN-3 is an abomination, offering absolutely NO stress protection to your handheld's SMA connector.

Comet offers 18" SO-238-to-SMA and BNC-to-SMA jumbers - which, at least, lets the 18" of thin coax separate the stress from the HT somewhat.

But the best BNC-to-SMA adapters I have found are from the mind of Stephen Gulyas. If you've seen my satellite presentation, you've seen them.

Stephen's adapters have a hard rubber base to them - which mates with the top of your HT. Stress to the center pin connection on your HT is virtually eliminated.

Here's Stephen's latest product and pricing info. Note that he only charges two bucks for shipping, no matter if you order one or a couple models. Haven't seen his adapters? Let me know - I'll send you a .jpg of one on my FT-60 or TH-F6.

This is an updated list of the radio models that my adapters will fit:

Yaesu: VX-1R, VX-2R, VX-3R, VX-5R, VX-6R, VX-7R, FT-50-R, FT-60-R, VX-10,
VX-150, VX-110, VXA-100, VXA-120, VXA-700,VX-800, VX-170 (Mod)
Icom: IC-T90A, IC-F50, IC-R5, IC-R2, IC-T8A, IC-T81A, IC-Q7A, IC-M1V
Kenwood: TH-D7, TH-G71, TH-F6A, TH-59, TH-K2AT
Alinco: DJ-V5, DJ-X3, DJ-S40
Standard: C508A, C510A
Radio Shack: HTX-200, HTX-400, HTX-245, HTX-420
Uniden: BCD-396T, BR-330T, ATLANTIS (Marine)
Midland: G-11 (GMRS)

Part # BGA-76
Yaesu: VX-5R, VX-1R
Icom: IC-Q7A, IC-M1V, IC-F50, M88 (Marine)
Kenwood: TH-D7, TH-G71, TH-59
Alinco: DJ-V5
Standard: C508A, C510A
Radio Shack: HTX-200, HTX-400, HTX-420
Uniden: BCD-396T, BR-330T, ATLANTIS (Marine)

Part # BGA-77
Icom: IC-T90A, IC-91A, IC-T8A, IC-T81A, IC-R2, IC-R5
Radio Shack: HTX-245

Part # BGA-78
Yaesu: FT-50-R, VX-10, VXA-100, VX-800

Part # BGA-79
Yaesu: FT-60-R, VX-150, VX-110, VXA-120

-
Part # BGA-80
Yaesu: VX-2R, VX-3R, VX-6R, VX-7R, VXA-700, VX-170 (Mod)
Kenwood: TH-F6A, TH-K2AT
Alinco: DJ-X3, DJ-S40, DJ-V17T

Once again, thanks for your help to promote my product.
Talk to you again later.

1810. BMHA Newsletter Articles Needed

Yahoo group: BMHA
Date: 2008-09-22 16:27:14 UTC
From: Mike Nickolaus
Topic: 1810 Message: 1810

It's time for a newsletter, if anyone has articles you want published, please send to Norm, N9ZKS our newsletter editor, myself or to the BMHA Webmaster.

Let's make this one a large newsletter, it's your chance to inform the membership what you are doing or have done or want to do.

Mike, NF0N
BMHA Secretary/Treasurer

p.s. if anyone would like to be a speaker at the next Dayton Hamvention BMHA forum, please let me know. It's never too early to get our program together

1811. Putting a rig together....Your input Please.

Yahoo group: BMHA
Date: 2008-09-23 04:31:47 UTC
From: ajeshadow
Topic: 1811 Message: 1811

I am in the process of getting TerraTrike and want to put the Yeasu FTM 10-R radio on board.

So If I get a 12v 6watt bicycle generator and connect it to a 12v battery and running wires to the radio it should work okay. Just not sure what would be the best 12v battery to get.

Not sure I should separate the control head from the radio (something about not as weather proof). So I think I could mount the rig on the left side of the seat or off the handle.

Since I am in the planning stage, none of this is solid and open to the input of the group. Thanks KF4SWS

Several issues:

Most bike generators are 6VAC. There is only one 12V that I know of, and I think it is somewhat hard to import (if you're in the US). You'll need to design a rectifier and regulator circuit, preferably one that will disconnect the supply when the batteries are charged to avoid damage if you are using gell cells. You might be OK using D cell nicads, since they can handle an overcharge situation much better then some other chemicals. If I ever get around to rebuilding my front wheel, I'll put a hub generator on, but any battery charging will be independent of any radios unless I can find a rock steady regulator circuit. The rated 6VAC can jump to 20 Volts at high speeds in some older models (which is why many people don't like to use generator lighting systems... they sometimes burn out lamps). Modern hub generators have some limiting built in to avoid this, but the simple bottle generators likely won't.

The other problem is that current consumption on this radio is about .5A on receive. Compare this to the VX-7R at around 200mA receive (I think that's at 7.4VDC). This was the biggest problem I had when I tried to use my Kenwood D-700 bike mobile, it just sucked down the battery in no time. And mobile radios typically don't put out their full rated power unless they are getting a solid 13.8VDC.

I realize that it looks like such a great idea, but an HT is a much better solution. I know I had the same thoughts when I first saw the FTM-10r, but from a practical standpoint, an HT with a mobile antenna really does offer similar performance. Even though that radio is rated for 50 Watts, you wouldn't want to have 50 Watts right next to you, and like I said, it wouldn't be likely to get there anyway. When I get the urge, I use either a Kenwood TH-d7 or TH-6a, depending on what I'm in the mood for, attached to a Diamond NR-770 dual band antenna on my bike rack. This works very well at getting to the APRS network and most repeaters I monitor. The only thing I miss from the D700 is the huge display, but I don't miss the weight and fear of trashing it in a crash.

But please don't let me stop you. Like I said, I'd be thrilled to find a dead simple charging system that would tie into a hub generator that didn't shunt the output back to the generator (most charger designs I've seen via googling are for windmills and solar panels, not bicycles), and the VX-8R looks like it does everything and more, if you like Yaesu.

For a simple charge controller check out
http://www.sunlightenergysystems.com/Site/Welcome.html
Check out the The Micro M+ and it is only $30 +$5 shipping
Mike Bryce WB3VGE is the author of the ARRL "Emergency Power for Radio Communications".

I use one for my 10 watt solar panel for charging a 12AH gell cell. I think it will do what you want as it is a series controller. I am sure Mike will answer your questions if the books don't. I seem to remember that the circuit was also in the "Handbook".

From: Walter - K5EST
Topic: 1811 Message: 1815

I am with N3KQX on the handy talkie rig. You can
also take along a precharged gel/nicad/etc battery
and plug it into your HT for additional operating time.

Another thing to consider is when you stop and leave
your bike / trike. You don't want to have radio gear
still left on the ride for someone to tamper with or
decide it would look better in their possession....Grin!

I use a Yaesu FT-817 at 5 watts for 2 meter FM
and sometimes go up to 440MHz on FM when
riding. When stopped a wire goes up in a tree and
then CW on HF is the mode. There is a sling on the
rig so it is not attached to the bike, so only the
antenna and extra battery are attached. One day
maybe 6 meters will have an opening when riding.
That would sure be a treat........heck, I'd probably wreck!

There is a 12V side wall generator

http://www.peterwhitecycles.com/dymotec.asp although the price is steep!

B&M Dymotec S12: Price: $ 285.00 (at 12V 6W)

Also see: http://www.bumm.de/docu/nojsmenu-e.htm

One thing I see is that the Dymotec S12 has a Electronically regulated voltage.

(it may make a charge controller for charging a battery useless as a charge controller is expecting 15-18+ volts to charge a 12V gel cell needing 14.1V to charge. You may be able to go into the S12 and disable it's regulator?)

Peter White Cycles, also has hub generators, but all are 6V.

BTW, Peter White Cycles is in Hillsborough, New Hampshire. And they import from Europe.

He also says: The Schmidt web site makes mention of a theoretical 12 volt version of the SON. I don't think Schmidt will ever produce a specific 12 volt version of the SON. I am not competent to answer questions about a theoretical 12 volt dynohub. So all email queries regarding such must, unfortunately, be ignored.

I looked at the Schmidt web and don't see a mention of 12V.
http://www.nabendynamo.de/produkte/dynamos.html

They do have links worth looking at:

http://www.vintagebicyclepress.com/VBQgenerator.pdf

http://www.myra-simon.com/bike/dynotest.html

http://www.audax.uk.net/lights/dyno.htm

Even at 6V's one problem with a hub generator, is the drag even when turned off.

That's the site I was thinking of. There's a lot of good information there, along with the late Sheldon Brown's excellent tutorials on dynohubs and lighting systems.

http://sheldonbrown.com/dynohubs.html

Most of the reviews of the SON hub say that the drag is negligible, even when when loading with a light. I figure I'll rig up a disconnect switch tied into my front derailer, so that when I went down to the granny ring it would automatically remove the load from the hub in order to maximize my pedaling into uphill motion.

1819. Greetings from a new member

Yahoo group: BMHA
Date: 2008-11-03 15:26:20 UTC
From: Stuart Benbow
Topic: 689 Message: 1819

Hi all,

A little about myself, I'm a relatively new ham at about a year and a half. I passed my tech and general tests the same day, but later feel I short changed myself as I mainly studied the test questions rather than really learning the meat of the tech stuff. As a result, I am slowly going through and trying to learn about electronics and the real how-to of things, as I'm really green at making anything work that isn't off the shelf.

I used to be an avid bicyclist, and spent several years pouring on the miles, but life got in the way. Lately, the bike has been coming out more and more often, and now the only time I don't ride is when I'm driving family to doctors appointments or range is a factor, usually over 10 miles at the moment as I'm still getting back into shape.

I'm gradually working on building endurance, trying to put the car away several months out of the year, and I'm thinking about training for a couple of several day rides next summer. That being said, combining amature radio with bicycling seems like a good fit.

Now the fun part, I've got a VX7R radio, a Maldol MH 510 antenna, and a mini-speaker mic. For the moment, the whole thing fits in my hydration backpack, with the antenna and mic cable coming out the headphone port at the top. Unfortunately, the antenna follows my back's angle and leans forward rather than staying upright. When I tried mounting the antenna to the frame, I stuck it low on the frame by the rear tire, and the tire seemed to interfere with the signal somehow. Again, green, probably a known reason not to put it right by the axle, but I didn't know any better.

What I'm trying to find is a way to wire a push to talk button on the handlebars that can release from the whole thing. I suppose, a quick release speaker/mic wouldn't be a bad idea either, as I'd like to stuff the radio in a pouch under the seat, hook up the mic/speaker to me, and the ptt to the handlebars. That way, if I spill, the wires just unhook, no damage. Probably not rocket science, but I don't have the know how. Any thoughts or pointing me in the right direction would be greatly appreciated.

Stuart, welcome to the group.
Mounting an antenna right at the bike's axle has at least a couple of major drawbacks:
1- The antenna height is even lower than your bike, already very low in terms of height gain...
2- The metal in your bike frame will tend to detune your antenna when mounted side by side. Very inefficient place to place an aerial.
Suggestions:
-Try a 90 degree angle adapter on your antenna-peeking-outa-the-hydration-pak scheme. It still will often not be perfectly vertical, but mobile antennas (in particular, bike antennas) are rarely perfectly vertical and they can still function fairly well. Keep in mind your back and/or whatever metal in the hydration pak is forming the only "ground plane" or counterpoise for the antenna.
Finding an antenna that works well on a bike is harder than on a vehicle, since there is so little metal surface, especially horizontal, on a bike. Thus I prefer half-wave or other "voltage fed" antennas that do not suffer as much for the lack of a ground plane. I've had good luck with commercial half-wave antennas that connect directly to the radio, and at times use a short BNC cable jumper to elevate the antenna elsewhere. I prefer to use a fiberglass or PVC narrow pipe tube about 4 to 6 feet long clamped to the rear-sloping nearest-vertical strut of the bike frame over the rear wheel to use for an elevated antenna mount. I've also had good luck with full quarter wave 19" whips in similar service, in spite of the lack of the beneficial ground as noted. I've had limited success using the rubber duck: It works, occasionally.... but not satisfactorily to me. Too many gaps in the APRS map HI.
I rarely try to actually talk while bike mobile in motion, I's perpetually out of breath and there's a lot of things going on around me, since I commute through Albuquerque to work and back. I let the APRS run on autopilot and only occasionally, when I happen to overhear a buddy I want to catch or a really interesting QSO, do I pull over and stop and chew the fat for a few minutes.
There are several hardcore guys who operate VHF and HF while in bicycle-motion, but either they're riding on much flatter territory than I am or are in much better shape (Not difficult!), or both.
My favorite bike antenna is a kids fiberglass bike-flagpole, with wire added to make it function also as a 2 meter J pole. It's long, tall, and ugly... and it works better than any other antenna on the bike. Some guys prefer mounting commercial antennas on their rear bike racks with an L bracket, which also works... but the pattern of the antenna is directly into their backs as they ride.
You can see some examples of my antennas and setup at

Take a look at past issues of the newsletter. There are numerous articles there that describe various ideas from the antenna I mounted on top of my helmet to my current Comet antenna on the back of a rack which I have mounted on both my track bike and my Giant 980C. There are over the ear ear bud speakers with cords long enough to allow movement while on the bike although I would avoid most of the inline PTT's unless the PTT is at least 30 inches from the earpiece/boom mike. I just saw one that had a place to plug in a PTT extension. A bit pricey. See <http://www.ottoexcellence.com/comm/ltheadset_home.html>
I have noticed that I could not find a suitable replacement for my old set at the last hamfest I attended. Also searches on the internet were not particularly fruitful.
The SAR-APRS group has used a number of rigs to allow search and rescue teams the ability to work with hands free rigs due to the probability they will be operating in difficult terrain.
Good luck, feel free to contact me directly if you have any questions about my adaptations.
Also I would love to see an article for the next newsletter on your experiences in getting set up in bicycle mobile operation.
(I'm the current newsletter editor.)

I neglected to mention in my last epistle that the current (Nov 2008)
issue of QST has a VERY interesting project on Page 73: A Wireless
PTT Switch for Mobile Operations....
See if you can beat me to implementing it on a bike.

Topic: 689 Message: 1823

I am using the medium-duty Bluetooth adapter setup from Klein Electronics. The PTT is a 1.5-inch circular "puck" with a clip on the back. It will pair with my Jawbone, too - and I have
"modded" my Jawbone with a custom ear mold...

http://www.headsetusa.com/bluetooth-reg-wireless-headset.html

http://www.averysound.com/as.jawbone.html

And my RAM mount of choice is at...

1824. Re: Greetings from a new member

Yahoo group: BMHA
Date: 2008-11-05 22:14:41 UTC
From: Stuart Benbow
Topic: 689 Message: 1824

Thanks all for the feedback.

I've been taking suggestions to heart, and so far, have managed to use the existing antenna on a 1/8" x 1" x 8" bar I mounted to the seat bracket, and fed it to the radio, now hung in a seat bag, out of the way with the keys and dial locked so I know I'm broadcasting where I plan, and the speaker/mic comes up to clip on my shirt for now.

Not a finished plan, but it's a start. I'm budget deficient at the moment, so this will be a work in progress for a while. Work should pick up in the next few weeks and make things easier.

After experimenting while riding I've discovered that my signal is terrible with that antenna. It gets there enough to receive others, but just doesn't pack enough quality into the signal to make me legible. Since I enjoy antenna making, I'll try tossing together a 2m j-pole for the time being and give that a try.

I'm starting to figure out the how of wiring the ptt, mic etc., based on what I've been reading. I looked at the wireless ptt article, along with some bluetooth solutions that exist, but I'm avoiding that for now based on my goals. I am interested in multi-day rides and won't necessarily have access to charging multiple devices each night at camp. As it is, I'm going to be making an external battery pack for the VX7R that uses standard batteries, so I can just swap them out, but still use full power, instead of the 2AA battery low power optional power that is available.

It's really interesting to read how different people solve the various problems and modify things for their specific needs. I'm really enjoying learning from the vast pool of experience that exists here.

Thanks again,
Stuart Benbow

I need advice on how to put together a wireless two meter hands free system with PTT. The Klein Bluetooth system mentioned in a previous post is not water resistant and their warranty states that if the unit gets wet the warranty is void. I don't know if this refers to the PTT button, the head set or the dongle. Maybe all of them. I do get caught in the rain sometimes. My HT is mounted in a plastic trunk so it does not get wet. I need advice on mobile antennas too, for bicycle mount.

Thanks very much.

Russ
I have been working with APRS so have no experience with PTT but can report a bit on antennas for 2m. I have tried 1/4, 1/2 and 5/8 wave verticals NMO mounted on a small plate attached to a rear rack mounted to the seatpost. The plate is stainless for testing but will eventually be aluminum and riveted to the rack.

My experience confirms what I have read regarding directionality--strong signal over the front wheel. Large antennas perform better than small.

I found my 8xAA battery pack insufficient to hold over the usual bumps. The pack was constrained by foam but I wound up restraining the batteries with a cable tie.

The 5/8 rides nicely but requires removal or be tied down prior to carrying the bike downstairs. My QTH is close to you so I would be happy to show my installation. You can see my track from yesterday. It shows as a car but I was on bike.

>>...wireless...2M...hands free...waterproof...HT is mounted in a plastic trunk...

Then the Klein setup would work just fine. Professional alternatives cost about five times as much.

The Klein setup is a 3-piece system: the piece that attaches to the HT will be in your plastic box. I use my own Bluetooth earpiece, because I have had an earmold made for me for it, which makes it incredibly comfortable (source cited below).

The Klein PTT button can be worn a layer below the elements...Clip it to your shirt under your jacket...or on the bottom of a glove.

Again, true weatherproof, professional units will cost an awful lot more.

>>...I need advice on mobile antennas too, for bicycle mount.

I am using a Larsen NMOQ 2 / 70B dual-band antenna on my bike, mounted on an extension to my rear rack. Excellent performance on 2M and 440 ham bands. Overall length is just 18". For VHF, it is a center-loaded 1/4 Wave. For UHF, a center-loaded 3/4 Wave. Could not ask for better performance on 2M and 440.

Photos of the installation are in the FILES section here!

Thanks Clint. I suppose expecting water resistance of 100 feet like my 17 dollar Casio Target special atomic watch is just too much to expect out of this kind of equipment. hi. I think I will go with the Klein. Getting rid of the wire tangle is something to look forward to. I like the names of your donkey and horse. Mjollnir, Thor's magic hammer.

Hello again

Seems I have a problem with the Klein unit. They don't manufacture
a "dongle" with a connector for my Vertex 150 HT. They make them for
lots of industial Vertexes but not HAM units. Anybody have an idea
how I can proceed?

Thanks,

russ N0BTI

Why not keep it as simple and inexpensive as possible?

Use the RAM mount to secure your HT to the handlebars. Use a Yaesu MH-34B4B speaker mic, and just clip it to a brake cable housing or even your shirt.

This keeps BOTH EARS available to your surroundings - which we all should heed.

I agree, keep it simple stupid. But I don't like wires attached anywhere on my body. The Y1 connector that Klein advertises on their chart would work but, of course, they don't manufacture a dongle with it. I also agree keeping the ears open is best. Most of my riding is done on bike trails where the only traffic is other bikers. I avoid riding on the road, with all the crazies, as much as possible.

Not intentionally playing devil's advocate, but...

>>...Most of my riding is done on bike trails...

Then you won't be able to remove a hand to hit a PTT button anyway - while you are moving. You'll be communicating while you are stopped for a drink or sandwich or for a break. All the more reason to simply improve your HT's antenna, and keep the radio packed away until you are stopped...

>>..I avoid riding on the road, with all the crazies, as much as possible.

That's a whole different thread...I have had more "incidents" on bike trails than I have had
on city streets. I feel much safer on city streets than trals or "dedicated bikeways."

But let's not get into this in this thread...(grin)

I occasionally actually "speak" into my bicycle-mobile radio system while mobile, but only rarely.... even on the straight and level, I just don't enjoy the heavy breathing, balancing act, working the PTT, etc. ..... but I DO let the radio run continuously in APRS mode on the "other channel" (can you guess I'm running a TH-D7?) as well as use the old IC-2AT with TinyTrakII.. they keep my speed and positions reported regularly to the internet while I concentrate on pedaling, staying upright, watching for all the various hazards related to biking, etc. Since I'm normally commuting, I rarely have time to "stop for a chat" but it does happen occasionally when I overhear someone say something particularly interesting.
Now, when I get my trike things may well get more involved radio-wise....

When I call "Bicycle Mobile" or "Motorcycle Mobile" I am mobile. I
currently have a PTT on my bicycle's single ear headset/boom mike cord.
I originally had PTT that was far enough from the headset that I could
velcro it to my handlebar and reach it with my thumb without taking my
hand off of the bars. I'm having trouble finding those anymore.

Not intentionally playing devil's advocate" ?

I too experience incidents on the trail but they are at 15 mph or so. Not at 60 mph with a drunk or a crazy behind the wheel. I averaged 2000 miles plus on trails every year for the past 12 years and have not hit anyone nor have I been hit. I have had to get the attention of parents who don't watch their kids, free running dogs, and cyclists who don't keep right or warn me when they pass but heck, nobody is doing 60 mph in a 2000 pound vehicle. Little kids darting across the trail or riding erratically are certainly a nuisance and I slow down and watch them very close because you don't know what they are going to do. I would much rather face a darting kid than a car driven by an inattentive driver.

Cell phones, strollers, roller bladers, Ipods, etc., all things that are on the trail but not much to worry about. I just holler, "on your left" or if they are all over the trail " biker coming". If they don't hear me because they have stuffed their ears with Ipod buds, I slow and holler louder as I approach. As long as I am not along side of them when they sense my presence I'm quite safe.

Norm: Take a look at the Pryme SPM-400A series. Single over-ear boom mike with separate PTT button. I zip tied the button to my handlebars near my right brifter (allowing left hand to be ready to work the front brake) and it worked quite well for in-motion use when I was supporting a local century ride. I just had to remember to take off or disconnect the headset when I got off the bike. You may want foam over the mike to reduce any wind noise. A B/T headset with on-handlebar PTT like the OP asked about would be even better, but I'd be nervous about the headset battery running low on a long ride.

More info here:
http://www.pryme.com/idx.cfm?cmd=_products&productCategoryID=62&step=_2

BTW, most state vehicle laws allow use of headsets on ONE ear.

Thanks for the model number. That was what I was using before. Guess I
didn't stay close enough to the bike, my old one quit working. I
couldn't find a similar one at the local hamfest's.
A new one is on order as I type.

The SPM-800 Series was our beefier, motorcycle setup...with two speakers to be mounted inside a motorcycle helmet, and a weatherproof PTT for the handlebars.

Just FYI.

You guys are confusing me. There's discussion of this on The East Bay Bicycle Coalition mailing list, too. I'd submit that this is enough off topic to be dropped here.

That being said, this is the common case where cyclists and automobiles conflict. There are just enough counterexamples for me to be hopeful.

"The 59-year-old physician said he stopped his red Infiniti sedan in front of the cyclists to "teach them a lesson," a police officer testified Thursday at Thompson's preliminary hearing."

Some of us are working on getting his physician's license revoked...seems he doesn't take the Hippocratic Oath very seriously.

I agree with Doug. Of initial interest, this topic has now become a more general bicycling discussion. This group is about the ham radio aspects of bicycling (or vice-versa, the bicycling aspects of ham radio.

Although the posts on this topic have been welcome to date, they have run their course as far as a ham-radio themed group is concerned. Since I am one of the group moderators, I'll watch future messages and act accordingly.

Happy Holidays and Happy New Year to everyone. Put some "happy" miles on the bike and make some "happy" contacts along the way.

Sorry to offend anyone. This is the most outlandish anti-bicycle case that the police officers
handling it have ever encountered - and I guess it is just geographically too close to home for me to not publicize it.

I am planning a bicycle trip from Ashtabula, Ohio south to
East Liverpool, Ohio.
I will be riding the rail to trails when possible.
I am looking for a SAFE path around Warren and the best
route from Lisbon to East Liverpool.

Also looking for bike friendly motel or campgrounds near East Liverpool.
I live near the Western Reserve Greenway in Ashtabula County.
Thank You
Bob

You should read "Low Gear Around Ireland" by Eric Newbe, but I'm not sure about the spelling. It's an ugly bicycle trip and there's a laugh on every page.

1859. bike tour around Dayton

Yahoo group: BMHA
Date: 2008-12-16 03:23:34 UTC
From: Barry Bogart
Topic: 1859 Message: 1859

Maybe this is a good time to announce my plans.... I am visiting my brother in Upstate NY in May, so am naturally combining that with a Dayton/FDIM visit around then (what's a few hundred miles and a couple of weeks when you are a retired and an ultramarathon cyclist?).

Anyway I am planning to Amtrak to Cincinnati, ride to Dayton/FDIM (camping at KOA), then I'll ride the Adventure Cycling Underground Railway Route (N. section) to Niagara Falls. Then I'll ride the Eire Canal trail from Buffalo to Rome, NY, near my brother's place. I hope I get to meet some of you at Dayton or enroute. I'll be on APRS - WV2J-7.

From: Keith Ballinger
Topic: 1861 Message: 1861

Hello all -
I have just joined this group so a brief introduction.

I have absolutely NO experience with operating bike mobile, but my doctor says I need more exercise so I thought that biking and ham radio would be a good combination. My job is mainly sedentary - sitting in front of a computer, sitting in a car or a plane, sitting in an airport, sitting in a meeting-room - you get the idea!

Actually, rather than a bicycle I had thought of a recumbent tricycle instead. At my age (60+) and with balance difficulties resulting from an inner-ear problem it seems the safer way to go. I have looked at "tadpoles" and "deltas" but am unsure of which would be the better for ham operating convenience. I anticipate using my FT-817ND on both HF SSB and VHF FM as circumstances dictate so I thought that a delta recumbent with the radio on the handle-bar would be a good approach. Note that I anticipate only leisurely riding around the countryside - no high-speed time trials!! If there are any recumbent users out there who have some good ideas then I am eager to hear.

Topic: 1861 Message: 1862

Keith,

My wife and I ride Terra Trikes, and I sometimes operate VHF from mine. I□ll send some pics to the site soon for you to have a look at. I use a WX2NJ Jurrassic Duck antenna, which works very well for a 2m antenna, flagpole and LED tail-light mount. Also, the tadpole design of the TerraTrike Tour is a very comfortable, stable ride. My wife, Suzy KD5YBF, has had several back surgeries and her MD won□t let her ride a conventional, but actually recommended her to ride the TerraTrikes. Also, UtahTrikes (www.utahtrikes.com) makes a commuter bag which fits neatly behind the seat and can carry a radio, battery and other goodies.

Jack KE4LWT

PS., also look up the WhizWheels owners group on Yahoo. You□d be surprised how many of them are hams!

1863. Bents

Yahoo group: BMHA
Date: 2008-12-18 01:30:16 UTC
From: Barry Bogart
Topic: 1863 Message: 1863

I'll be taking the 'half bike' (not the VE7VIE/VA7VIE tandem) for this trip, Scott. The YL isn't riding much because she has vertigo.

So, Keith, I'd like to hear about that inner ear problem. The YL has been unable to do her regular job for 8 months because of undiagnosed vertigo. Do you know what causes yours?

As to your questions, I know that 'bents are very popular with hams, but I don't know much about them, other than they are too slow going up and to fast going down! I have heard that tadpoles are more stable in turns (especially useful when going too fast downhill!). But there are some very light 'bents that are fast uphill, if you want to spend the money (I like the Wind Cheetah - http://www.windcheetah.co.uk/). Green Speeds are nice too: http://www.greenspeed.com.au/. There is a store here in Vancouver (Cambie Cycles) that specializes in 'bents (http://www.cambiecycles.com/).

I beg to differ on your age comment! I'll be 65 in a few weeks and haven't slowed down yet. Ken Bonner is among a few aging Canucks who know how to do it (http://www.ultracycling.com/about/aboutmag.html)! Seriously, anyone can ride any distance - you just have to start slow (and stay slow, like me).

From: wa9lkd@k0swi.org
Topic: 1863 Message: 1864

Now I don't operate a rid on these trails, but at 61 years old my passion is mountain biking - singletrack in the woods,

I started riding 3 1/2 years back after a stroke caused by a failed heart valve. My cycling, specially singletrack, has done miracles for my balance and coordination.

Never too old to ride. RIDE TO LIVE!

Barry,

You taking a long bike or a short one?

Hello all -

I have just joined this group so a brief introduction.

I have absolutely NO experience with operating bike mobile, but my doctor says I need more exercise so I thought that biking and ham radio would be a good combination. My job is mainly sedentary - sitting in front of a computer, sitting in a car or a plane, sitting in an airport, sitting in a meeting-room - you get the idea!

Actually, rather than a bicycle I had thought of a recumbent tricycle instead. At my age (60+) and with balance difficulties resulting from an inner-ear problem it seems the safer way to go. I have looked at "tadpoles" and "deltas" but am unsure of which would be the better for ham operating convenience. I anticipate using my FT-817ND on both HF SSB and VHF FM as circumstances dictate so I thought that a delta recumbent with the radio on

the handle-bar would be a good approach. Note that I anticipate only leisurely riding around the countryside - no high-speed time trials!! If there are any recumbent users out there who have some good ideas then I am eager to hear.

Regards,

Keith VA3QF

Cambridge, Ontario

CANADA

1865. Re: [BMHA] Bents

Yahoo group: BMHA
Date: 2008-12-18 14:12:53 UTC
From: Bill
Topic: 1863 Message: 1865

I'm with you guys.

My college room mate and I are planning a ride from my home to his in Vonore, TN (Eastern TN) this May.

I'd suggest doing GOBA as a way to see all the different ages, shapes and sizes on bicycles of all types.

Oh, I'm 66.

It's so irrelevant, I almost forgot to mention it.

The hardest part is getting off the couch.

Best,

Bill

1866. Newsletter

Yahoo group: BMHA
Date: 2008-12-27 00:56:12 UTC
From: Norm Huber
Topic: 243 Message: 1866

Here I sit, watching 2008 trickle by. The roads are fog shrouded and ice covered. My HF dipole is laying on my roof, felled by last weeks ice storm. I was thinking about spring and the thought of a newsletter to talk up Dayton crossed my mind, reminding me of the fact that I never got a fall newsletter published due to a lack of input. Didn't anyone do any riding this summer? Everyone can't use my excuse that a broken leg kept you off the bike. Heck, I was ridding my track bike to the last couple of PT appointments.
Please take a few minutes and send me (Your newsletter editor) some material on anything remotely related to bicycles, ham radio, travel, or of interest to the group.

1867. Dayton

Yahoo group: BMHA
Date: 2008-12-27 00:57:43 UTC
From: Norm Huber
Topic: 1867 Message: 1867

The QNC group has brought up the subject of Dayton attendance. That got me to wondering who is planning to be at Dayton this year.
Secondly, is anyone planning a bicycle ride as was done in years past? I haven't gotten a bicycle rack built for my Goldwing yet, so if there is a ride planned I may have to bring my RV and truck. Don't know if my truck will want to go to Dayton this year after the abuse it suffered at Dayton last year.
Let's talk it up.

Norm,

If you take your bicycle to Dayton I'll drive my pickup from Texas
and take mine, too What should I bring, my Bike Friday or my
Cannondale? Is two bikes considered a group?

I'm not sure. Wouldn't want to upset the English teachers.
We used to have some members from Ohio who knew some good roads just NW of Dayton. I think some members lived or camped in that area. If they are not riding or bringing bikes, I'm wondering if they could send me some directions so I can load them into my Garmin V. Might let the APRS boys know we're on the road so they could track us from the floor at Hara. Also we could call beck in through local repeaters.

On another subject, are you familiar with the BP MS 150 in Houston? I have been down the last three years with the motorcycle to provide support to the ride. It would be fun to have a few VHF/UHF radio equipped bicycles among the riders. The field is full but they are still looking for volunteers. It is a sight to see 13000 bicyclists on the road. We have a thrill following the "Turtle" up the hill to the state capitol in Austin Sunday afternoon.

Hi Norm,

I have a TT-3 (n7net-6) for the bicyle and a TM-D710 (n7net-8) for the pickup.

I haven't particpated in the event you mentioned. It reminded me of the Hilly Chilly in Seattle. The number of bikes was controlled by how many could fit on the Washington State Ferry. Returned in the evening everyone was wearing newspapers on their arms and legs.

Topic: 1867 Message: 1872

I'll do my best to get my bike(s) out. I'm moving to Dayton on Jan
31. I
guess that will make me "from the area" by then.

I've got a [group, bevy, rack, peloton, {pick one}] of recumbents...both
singles and tandems. And, maybe I can get one of the batteries for my
FT-50s rebuilt for the event. We might be able to outfit someone on a
CycleGenius or my son's mountain bike if they can't bring their own.

1873. Dayton Hamvention - Bike ride? G-earth link

Yahoo group: BMHA
Date: 2008-12-28 21:49:38 UTC
From: Arnie Grubbs
Topic: 1873 Message: 1873

Hello Group!

I have been lurking on the E-group for a while and have been watching with interest the discussion of a bike ride at the Mention.

I remember that there was an organized ride several years ago, but lately there has not been a lot of interest in a ride. I suppose since it is such a busy weekend, that no one wanted to rip themselves away from all the great deals in the flea Mkt and inside... Also the odds of hitting a rainy day were very good, if I remember correctly.

Anyhow, I hope that we can start a new Hamvention ride that will be of interest to the BMHA members (and non-members too). Saturday afternoon would probably be the best time for a ride.. it will be warmer and people will have had time to look around the Hamvention.

I did find a link on the web that shows some of the bike trails in the Dayton area. To use the info provided, you will need the - google earth - application. This link tells how to load the .KML file into Google earth to view the info.

http://docs.google.com/View?docid=dgcrpw3z_2g2vwpqgk

Starting at Eastwood park, there are several trails that cross there and could be used for a short ride. Also it is located near several hiways so it should be easy to get to, and is not to far from the FDIM event.

Any suggestions/ ideas/ comments on would be helpful! Maybe a different route would be good? A place to stop for refreshments or lunch would be helpful too!

I don't think the ride should be about making a lot of miles, but rather a short ride (10-20 miles?) , where people could see other BMHA members "mobile shack"s and exchange ideas, and get on the air for a bit.

I hope that we can get something going this year!
I plan on being there this year and riding if at all possible.

1876. January 1st Bicycle Ride

Yahoo group: BMHA
Date: 2009-01-01 14:55:09 UTC
From: Mike Nickolaus
Topic: 1876 Message: 1876

I've had a long standing tradition of riding my bicycle on January 1st. For the last 30 years or so, I ride regardless of the weather. Sometimes it's been around the block, down the block while straddling the bike in the deep snow or ice. This year it looks like we will have around 30 degrees so it may be I can get a few miles in. I am going to do it this year on the trike so at least I can't fall over! We still have some ice and snow on the streets here in North Eastern Nebraska.

I started this tradition when I lived in Orange County New York and our bicycle club had a yearly ride called the IceCycle Ride each January 1st.

Let's hear about any other crazy folks that do this on the 1st. Anyone is welcome to join me in South Sioux City, Nebraska today. I am going to sneak the ride in just before the Nebraska-Clemson game. Go Huskers!

Happy New Year to all BMHa'ers

Mike, NF0N

We do between 60 and 100 in the hills west of Ft. Worth (actually,
West of Weatherford) every Jan 1.

As you say Mike, it sets the tone for the year.

Happy New Year,

Bill

On my way out the door for my traditional ride. IT's sunny and forty-
something degrees. Yippee! Happy New Year everyone!

1879. Re: Dayton Hamvention - Bike ride? G-earth link

Yahoo group: BMHA
Date: 2009-01-02 20:03:00 UTC
From: shepner2000
Topic: 1873 Message: 1879

Ive brought my Greenspeed to the forum for a few years now and it would be nice for once to go for a ride too :) My vote would be for after the BMHA forum on Sunday. That day is generally pretty empty anyways.

For routes, I cant help much but John KA8ZSB might be able to provide some input since he lives in the area and rides the trails. However since I plan the routes for the local recumbent club, I can provide some thoughts: Since this is purely a social ride, make sure there is plenty of time before and after to chat. For the route, keep it short, easy and preferably scenic. A 20 mile trip at 10MPH avg with a lunch stop would be very pleasant. Even for those who havnt ridden much. Try to avoid busy traffic areas and gravel paths if possible. Make sure the fast riders know to wait up for the rest of the group.

For some ideas of what Ive put together, take a look at my site:
http://www.gmrbc.org/
Since I tend not to read the forum as often as I really should, feel free to email me directly with questions.

1880. Re: Dayton Hamvention - Bike ride? G-earth link

Yahoo group: BMHA
Date: 2009-01-04 12:45:10 UTC
From: Arnie Grubbs
Topic: 1873 Message: 1880

Hi John,

The route sounds interesting, but I am not too hot on the idea of a Sunday afternoon ride. After the BMHA forum on Sunday, (assuming its on Sunday- no word yet) we have to take off
and head for home. We (there are 2-4 of us car-pooling) have a 750-800 mile drive to get home. Several of us have to work Monday afternoon, so we can't stay to long on Sunday..

I am planning on getting to Dayton Wednesday night, so that we can attend some of the activites at the FDIM gathering.. so maybe something could
be set up for Thursday sometime? Just a thought..! It might be to early
in the week for some who are traveling a long way to get to the Hamvention.

I did notice on google earth that a few of the trails that look like a Rail to Trail conversion, that the surface looks like chipped limestone screenings. If I bring the trike to ride, I would prefer not to ride
on a soft surface.. if we are going to be on a soft surface I'll have to
bring the LWB 2 wheel 'bent. I haven't done much with setting my 2 wheelers up for HF, but I'll have to give it some thought..

Anyhow... we will have to see how this all works out.
We all need to keep up the dialog on this, so something can be set.

I am looking forward to going on a ride while at the Hamvention!

Thats a pretty good drive there. I dont have quite that far to go (only ~400mi) but I agree that would be rough to do with those distances. It probably would be a good idea to avoid a group ride after dark so we wouldnt want to start too late. That leaves Fri and Sat for options. Of the 2, Id much prefer a late afternoon Friday ride. Hows that sound?

Since there is no information on Forum schedule, I would agree with
that. Perhaps a end of ride (car park for those not riding bicycles to
ride) near a Restaurant would be good so we could sit around, eat and
talk radio.
Sunset will be 8:45 PM so we have time for a ride after the forums for
the day end.

Hi Arnie,

Dan, WD8AAU here. And here is in Dayton. I can't claim to have been
on all of out Rail to Trail network, but all of it I have seen has
been paved. Some of the trails are quite new and may have been under
construction when the Google Earth photo was taken.

If a route is planned before the big day, I'm sure we can figure out
which bike you should bring.

See you in May. Maybe at the FDIM get together.

Dan (WD8AAU)

Thank you, Scott. But you have to thank my wife - who bought me the cool Dremel toolkit a couple years ago ... (grin)

Dremel offers a great Polishing Kit ... and also a separate (I think a newer accessory) wire
brush wheel that is made from soft-enough metal to polish and not eat up metal and aluminum parts.

Every part was removed from the frame, because I thought it was going to need refinishing: It had a dulled, grey-ish sheen to it. But after removing all parts and gently using hot water
and plain old soap to it, that DuPont Imron came right back!

It was a satisfying project ... thanks for your message.

1888. Dayton Hamvention Forum

Yahoo group: BMHA
Date: 2009-01-12 19:27:04 UTC
From: Mike Nickolaus
Topic: 1888 Message: 1888

I have been contacted by the Hamvention forum chairman asking if we are interested in a forum at the 2009 Hamvention. I indicated BMHA would like to host a forum again in 2009 asking for 1 1/2 hours again on Sunday morning. This is our usual forum time and has worked quite well in past years. The chairman indicated they will notify us by February 15th as to our request. Since our time is on Sunday we usually don't have a problem with our forum and would expect it to be approved.

Anyone who would like to offer their services to be a speaker or presentor at our BMHA forum please contact me to discuss details. Speakers will receive a Hamvention pass in addition to feeling good about being helpful!

I notice quite a bit of interest in a bike ride during the Hamvention and hope someone will take the ball and run with it and organize it.

We are also looking for newsletter articles for a new issue and if enough have articles, an issue prior to the Hamvention is possible. Send your articles to n9zks@... or myself.

1889. Opportunity for a Free Adventure Cycling Voucher or Special Issue

Yahoo group: BMHA
Date: 2009-01-15 00:24:46 UTC
From: Mike Nickolaus
Topic: 1889 Message: 1889

As you may know, BMHA is an affiliated Bicycle Club of Adventure Cycling. I have received two vouchers for a one year membership to Adventure Cycling to be given to two of our members. If you are a member of BMHA and are interested in one of the memberships, please send me an email indicating an interest. I will randomly select two from the emails and send the vouchers to the winners. Please send me your email by January 23rd to be considered. Additionaly, Adventure Cycling sent eight Special Issues and those will be sent to an additional eight winners.

Please send your email directo to me at: nf0n@...

Remember this is for BMHA members, you must be in the BMHA database to be considered. If you are a YahooGroup BMHA user, this is different than the BMHA database. You would have sent in a membership form if you are in the BMHA membership database.

Good Luck,

Mike, NF0N

BMHA Secretary/Treasurer

Hi Group,

Well, looks like no one is going to just "Jump In There" to help plan and organize this, so I guess I will give it a go if no one else (some one closer ?) wants to speak up and give it a try.

After talking with a few people, I think that the best time would be Saturday afternoon with a start time of about 3-4 PM.

This should give people a fair amount of time all day Friday and Saturday morning and part of the afternoon to check out the Hamvention. The ride lenght and speed will be up to the individual. The trail should provide about 20+ miles of travel if you wish to go to each end.
I hope that we can have a period of time for 'show and tell' of everyones 'rolling ham shack' and get on the air for a QSO!

Looking at the trails near the Hara convention center on Google Earth it looks like the Wolf Creek trail is nicely located.

It looks like a very easy ride on paved surface with a few street crossings but no rideing 'with' traffic. There are some places to stop for food and drink along the trail too.

Starting point could either be at the trail head at the change over point of Shiloh springs road and Air Hill Road. This is about 6 miles west of the Hara Convention Center on Shiloh springs RD. There is off street trail head parking but no 'facilitys'.

OR we could start at the trail head at the intersection of Arlington Rd and Upper Lewisburg Salem Rd, which is just off I-70 at Brookville. This trail head has more parking, several places to eat near by, and is about 4 miles from the first trail head I mentioned.

A firm start time and Location will be posted as the date draws near.

Looking to hear from the group, I hope that we can have a great turn out!

Congratulations to WD8PVB and KE4LWT/KD5YBF, you are the 2 winners of the Adventure Cycling membership voucher. I will be mailing to you using your QRZ mailing address. Winners of the special edition of Adventure Cycling were Chris Fanning, N7NET, N3VHJ, W8HI and WD8RIF. These also will be mailed using your QRZ address or mail address if not licensed as Chris is although he indidated he is working on his Tech licence.

Congratulation to all and hope you enjoy the subscritions and special issued.

1902. Dayton Hamvention Forum

Yahoo group: BMHA
Date: 2009-02-11 16:25:43 UTC
From: Mike Nickolaus
Topic: 1888 Message: 1902

For most years we have had formal programs at the Hamvention BMHA forum. I am considering for this year having as many as possible bicycle displays of Radio/Bicycle setup's. How many of you would be interested in bringing your bicycle radio setup to Dayton this year? Since there are plans to have a bicycle ride on Saturday, would you also be interested in displaying your setup at the Sunday forum?

We could have a short BMHA introduction and then let everyone display their setup and let everyone get a real close look at the diffferent techniques we have.

Let's have some discussion about this and then I can make a decision as to which way to go. If you prefer the formal presentations let me know.

Thanks,

Mike, NF0N

BMHA Hamvention forum moderator

Hi Mike,
just thought I would drop you a line as regards bike mobile.
I have been working HF SSB bicycle mobile for about 5 years and I rally enjoy it and get great results working from close to the sea where I live.
I would love to bring my bike to Dayton, but it would take me a bit too long to pedal over there!
Anyhow, please take a look at the set-up on www.qrz.com/g4akc
Good luck with the convention.

Best of 73's ...

Dave Starkie G4AKC ....

Well, I'll be bring my bike and it will be the road bike this year.
I'm tempted to figure out how to pack it and go ride with David, G4AKC
sometime. Maybe I should take my old Metcalf frame and return it to the
shop for repairs and then ride it afterward. Trouble is I can't afford
the Campy kit anymore.

1905. Tuner Suggestions?

Yahoo group: BMHA
Date: 2009-02-13 20:25:29 UTC
From: DrRodney
Topic: 1905 Message: 1905

I'm looking at getting an autotuner to use on the bike with my FT-817. I've been using a manual Emtech ZM-2, which I like, but it was destroyed in an accident, and I'd like to look at auto tuning options. I've looked at the Elecraft T1 and the LDG Z-817. The Z-817 looks bulkier. I was hoping to find something I could band right to the radio to keep it secure. Any suggestions on either of these products or another option?

Thanks!

At least one person has installed the T1 in the battery compartment of
the radio, IIRC.

And I think I have a T1 kit sitting around here taking up space.
If you're interested in it at a good price, let me know.

Have you considered inviting any of the bike/trike manufacturers to
display one or more of their products configured "radio ready"? I will
have a Wizwheelz Teratrike Cruiser
<http://www.terratrike.com/cruiser.php> configured for 2M APRS
and 2M/70CM FM mobile but doubt that I will bring it.... may bring
digital
pictures instead.

From: vhuntertdi
Topic: 1908 Message: 1908

Hi Group!

A little more info on the ride is now available on the
www.BMHA-HAMS.org website.

It shows some links to the trail's web site, and a couple of .jpgs
that I hope will be of use to figure out how to get to the trail head!

I hope we have a good turn out, I am looking forward to seeing a lot
of cool rolling hamshacks!

1909. Dayton Hamvention Forum Approved

Yahoo group: BMHA
Date: 2009-03-05 16:04:34 UTC
From: Mike Nickolaus
Topic: 1909 Message: 1909

We have been officially approved for the BMHA Forum at the 2009 Dayton Hamvention.

Date: May 17, 2009
Time: 0930-1115
Room: Room 4

Room 4 looks to be one of the larger rooms and I think this is the first time in this room.

For this years program we are encouraging as many bicycle mobile setup's as possible to be on display. I know of at least 4 who are planning on bringing their bicycle display. No comittment is necessary but if you are planning to bring your mobile bike setup, please drop me an email to let me know your plans. For those who have a powerpoint or presentation and would like to present, please let me know and I will have you listed as one of our speakers and you will receive a Hamvention pass for your efforts.

This could be the largest mobile bicycle display in Hamvention history if enough of us bring our setup.

There will be more information in the next issue of the BMHA Newsletter that is currently in the works. If you have additional articles, please get them to Norm, N9ZKS our newsletter editor.

Hope to see many of you at Dayton, both the BMHA ride on Saturday and the Forum on Sunday morning.

Subject: [BMHA] Dayton Hamvention Forum Approved

We have been officially approved for the BMHA Forum at the 2009 Dayton Hamvention.

Date: May 17, 2009
Time: 0930-1115
Room: Room 4

Room 4 looks to be one of the larger rooms and I think this is the first time in this room.

For this years program we are encouraging as many bicycle mobile setup's as possible to be on display. I know of at least 4 who are planning on bringing their bicycle display. No comittment is necessary but if you are planning to bring your mobile bike setup, please drop me an email to let me know your plans. For those who have a powerpoint or presentation and would like to present, please let me know and I will have you listed as one of our speakers and you will receive a Hamvention pass for your efforts.

This could be the largest mobile bicycle display in Hamvention history if enough of us bring our setup.

There will be more information in the next issue of the BMHA Newsletter that is currently in the works. If you have additional articles, please get them to Norm, N9ZKS our newsletter editor.

Hope to see many of you at Dayton, both the BMHA ride on Saturday and the Forum on Sunday morning.

From: Bela Ryan
Topic: 1918 Message: 1918

Tell your Governor to Build Bicycle and Pedestrian facilities with Economic Recovery Funding

Congress set aside funding for the transportation enhancement program, which funds bicycle and pedestrian projects. However, they also gave states a time limit. States must identify which projects they want to fund, and to obligate the funding to those projects.
http://www.americabikes.org/docs/TE_funding_by_state.pdf

If states do not do so, they will have to give back the money.

CALL or WRITE your Governor now to ensure that important bicycle and pedestrian projects get built, and the funding is not wasted.

On Monday, March 2, 2009, America Bikes sent each of the Governors a letter requesting they obligate their transportation enhancement funding in a timely manner.

Now we need you to follow up: CALL your Governor now to ensure that important bicycle and pedestrian projects get built, and the funding is not wasted.

Take Action!

Topic: 1922 Message: 1923

I'd use either a Hamstick or modified helically wound modified CB antenna. There are lots of mounting options available. I did one on a rack mounted on the back of my trike. I think I'd add a 10 foot counterpoise connected to the antenna base and run along the bike frame to add just a measure more effiecency. 10 meters is looking better each day now. Will the Cherokee accept an external speaker-mike?

Alvin,

You might consider "bigger is always better" in antennas, so if it's longer, it's going to radiate better.

More important, you'll hear better unless the skip is in and then, it's just monkeys in a barrel fun regardless what you're using.

Considering a 5/8 wave outperforms a 1/4 wave on 2, that may be another consideration.

Also, having no coils but rather a simple whip will help too.

I've had good luck using a ground plane (my bike's carbon fiber) or making a good contact with a steel frame - bare metal to bare metal and using the whole bike as a counterpoise.

Best,

Bill

If you want minimum "tree whacking," Larson makes a 10 meter version
of their base loaded CB antenna.

The counter-poise you offer on a bike is the same whether a Hamstick,
102" whip, or the Larson. You could rework a K40 or other CB antenna
designed for deck mounting or use one cut for the commercial low-band
.

I find a Antron A-99 mounted to the back fender works really good J/K.

I've had good luck with a 102" whip and a cheap clamp mount on the frame for 10 meter mobile. If the 102" is more than you want to do, Larsen makes some NMO style base loaded whips that are pretty short (compared to the 102" that is).

Hello.
I am very thankful for the response I have received from all of you.

I think then that the best option for me will be using a 102" s/s whip attached to the frame with a homemade bracket attached to the wheel quick release.

I was planning to use it in my full carbon road bike (I am a roadie) but then an aluminum MTB would be better for my application for the frame to act as the counterpoise.

The AH-100 does not have an external microphone unfortunately. But still it is quite manageable if you do your hamming with the bike stationary.

Thank you all again.

Best regards from the tropics.

Alvin,

I neglected to mention that using a half wave antenna (either a Larson base coil loaded whip or the full size half wave, 102-104" you're considering) will require a resonant feed line.

For 2 meters, that would be around 57".

Interestingly, Larsen makes that feed line specifically for bicycle mobile amateur radio work. It includes BNC connector and sleeve at the radio end. However, they would be happy to substitute that connector with whatever you want.

You can also ask them to add an NMO connector at the other end.

We tested this and other set-ups on GOBA some 12 years ago and came up with what is called the GBR-1 and GBR-2, the latter being for a tandem bike with a longer feed line requirement.

Google GOBA, then

at the bottom of the page, click on gobahams.org, then

click on Operations, then click on "here," in the third paragraph down.

Better, Alvin,

Because you have a carbon fiber bike as I do . . .

See if this gives you some more insight:

You would want to do a similar thing but at 10 meters.

Again, Larsen engineering will work with you on the feed line, even to the point of calculating the feed line length for the frequency on which you want to operate.

I think you should go with the biggest thing you can get your hands on
which would be the 102- 104 inch whip, if that works for you.

If Larsen has that, go with that.

Otherwise, go with the longest, biggest thing Larsen has for 10 Meters.

Then, call them and ask for "engineering."

Then ask that person to give you the proper length feed line for a
half wave antenna.

Tell them what you are doing and what you want.

They, the engineer, will give you the appropriate feed line.

I say this because we've had such good support from them on GOBA.

Feel free to mention GOBA and my name.

Although they were bought out by another company, they still have the
same people, who are more than accommodating.

Be sure to get a sleeve on the radio end of the cable as that's the
most worrysome part or section of the whole set-up.

If you have any issues at all, let me know and maybe I can help.

Again, get the biggest, longest, without a coil if possible antenna,
with an NMO mount as that's pretty universal for any other antenna you
might want to mount.

Hope I'm being of some help.

Best,

Bill

1932. Question about vhf/uhf bike mobile setup

Yahoo group: BMHA
Date: 2009-03-26 22:14:34 UTC
From: w0rmt
Topic: 1932 Message: 1932

Greetings all-

I'm thinking that this is the year I will finally mount some type of antenna on my bike(s) (or at least one of them) for both vhf and uhf work with the HT. Having read some of the fine articles from the GOBA folks (such as http://www.gobahams.org/how_to_wire_a_bike.pdf) about using Larsen 1/2 wave antennas for 2m got me thinking.

How have folks mounted antennas on their bikes for both vhf and uhf? I'm aware of the "Jurassic Duck" style dual band J-poles enclosed in cpvc, but I'd rather have a much slimmer, lower profile, whip-type antenna. Weight is also an issue: the lighter the better. Do folks use dual band antennas that are 1/2 wave on 2m and 5/8 wave on 440? If so, would the 440 side behave without a ground plane? I don't think so. I suppose I could just use one band or the other and change out antennas and feedlines when I want to change bands, but this isn't practical for long rides away from home.

Other options?

Thanks in advance.

1933. Re: Question about vhf/uhf bike mobile setup

Yahoo group: BMHA
Date: 2009-03-26 22:37:16 UTC
From: Mike Nickolaus
Topic: 1932 Message: 1933

I have the Diamond NR770HB dual-band antenna and like it very well. It is 1/2 wave on 2 meters and 2 5/8 on 440. It has good gain, solid on a bike and folds over for transport. I also use it on my car. You can get it in UHF or NMO mount and in nickel or black finish. I have had one for at least 10 years and it still works well and mechanically still solid. Think it is about 41 inches tall and I have a small flag on the top of it. My mount is a homemade stainless steel plate bolted to my rear rack. Cost is in the $50-$60 range depending on where you purchase it. Here is a link to the page:

I'm aware of the "Jurassic Duck" style dual band J-poles enclosed in cpvc, but I'd rather have a much slimmer, lower profile, whip-type antenna. Weight is also an issue: the lighter the better. Do folks use dual band antennas that are 1/2 wave on 2m and 5/8 wave on 440? If so, would the 440 side behave without a ground plane? I don't think so. I suppose I could just use one band or the other and change out antennas and feedlines when I want to change bands, but this isn't practical for long rides away from home.

So it works OK on 440 w/o a ground plane? I've had the Diamond NR73BNMO on my truck for years and really like it. Electrically the same antenna, but lower power rating and a bit shorter. Perhpas I'll build a mount and just run a test with my existing NR73BNMO off the truck.

Thanks for the reply.

Here's a couple links to my descriptions of my homebrew bike-mobile J pole setup:
http://www.qsl.net/w5aox/W5AOX%20APRS%20BikeMobile.html
http://www.qsl.net/w5aox/images/JPole_W5AOX_Bike.jpg
Not only is the J pole a superior performer but it attracts attention as well, a PLUS on a bicycle.
Only disadvantage I note: Requires occasional maintenance (Every 2 or 3 months in my usage patterns)
Most 144 MHZ J poles will exhibit a usable SWR at 440, though not stellar performance (who knows what the pattern is). I usually have my TH-D7 set up for APRS on 144.390 on one side and my 444.150 remote base on the other.

Jim-

thanks for the links and info. I have built a similar j-pole before for a cruiser/neighborhood bike and it performed well. However, for the current application I'm thinking of my road bikes, which I ride long distances (~100 miles/day) on organized rides. J-poles are simply too big and cumbersome for this application, at least for me. I'm also not interested in attracting any more attention than I already do in my colorful bike kit, which I think is enough. That's why I'm trying to go low-profile with a whip. The less noticeable, the better, and the lighter, the better.

1937. Re: [BMHA] Question about vhf/uhf bike mobile setup

Yahoo group: BMHA
Date: 2009-03-27 00:21:29 UTC
From: n1evh@verizon.net
Topic: 1932 Message: 1937

I've ben playing around with the idea of putting a mobile antenna on my mountain bike this year for VHF/UHF.

I was thinking of putting a rack on the back of the bike... and then mounting a mirror mount onto the rack. Now most mirror mounts have a 3/8-24 thread mount on it... so I would drill it out so I could put one of those 2" SO-239 barrel connectors on it.

The antenna that I have that I was thinking about using is a Diamond CR627B tri-band antenna (1/4 wave on 6m, 1/4-1/4-1/4 on 2m, and 5/8-5/8-5/8 on 70cm). The antennas offers 2.15dBi on 6m, 4.5dBi on 2m, and 7.2dBi on 70cm.

Now when I bought this antenna years ago... Diamond advertised that "most" of their antennas were "ground independent"... they didn't require any additional groundplane. This antenna was advertised as such... except for 6m which required a groundplane. I was thinking that maybe the bike would be enough of a groundplane for 6m.

For battery... I made up a NiMh battery. I went to Radio Shack and bought four of their 8 AA battery holders. I then bought a bunch of 2600mAh AA batteries off of eBay. I put 8 batteries into each battery holder and wired the 8 battery holders in parallel. This give me a battery that is 9.6v and about 10.4Ah.... which is good since most of my radios will give me 5w output using 7.2v (VX-5R, VX-7R, VX-8R), 7.4v (TH-F6A), or 9.6v (TH-D7A, FT-817).

This would work well with my Yaesu VX-7R. I guess I could buy a 2m/1.25m/70cm tri-band mobile antenna to put on the mount if I were to use the Kenwood TH-F6A for 223 MHz. I would like to figure a way to mount and use my FT-817 so it wouldn't take a beating on the bike when going over bumps and so on.

Has anyone else tried a similar type of setup???

From: Stephen M. Shearer
Topic: 1932 Message: 1938

My plan is to mount my dual band Larson to the "luggage" rack on the back of the bike. Since I use a saddle bag, I plan on using 1/4 wave radials (with springs). I expect the rack will act as part of the ground plane and I may try "tape measure" radials as they will flex and return to shape.
Another option? Rather than cutting the coax to an odd 1/4 wavelength... Try beads on the coax to define the first 1/4 wavelength - on 440 it will be 3/4 wavelength.

From: Tim
Topic: 1940 Message: 1940

I was looking through the latest AES catalog and saw and advertisement for Lido Mounts and noticed that they have one for bikes, the LM-1000EXP. AES has it in stock for $20 but I can't seem to find any additional information on it.

Has anyone in the group used this mount? If so what did you think about it and how securely did it hold the HT in place? Also, does anyone know what type of material this is made out of?

Thanks for any help and 73,
Tim

I use Ram Mounts for my HT and my Garmin NUVI200W. They both work fantastic.

The only caveat is that you should use a velcro wrap around the HT, never trust the belt clip.

I use a Yaseu FT60R and a Bendix EPH. The Bendix doesn't have a belt clip so I use my nylon holster attached to the mount.

Take care

1943. Mounting options for the yeasu vx-8r

Yahoo group: BMHA
Date: 2009-04-01 11:11:07 UTC
From: Christopher Lee F.
Topic: 1943 Message: 1943

Hey guys,

My name's Chris, I'm a pretty recent member to BMHA. Not new to bikes and I was introduced to ham at an early age (8 or so). I'm studying for my tech exam.

Bought a Vx-8r that i use for scanning and geo-caching. which i intend to mount on my touring bike.

So my question is...
What are my options for mounting this thing? I've looked around a bit and am just not sure what the best option is.

Thanks guys! great group!

See you on the road!

Christopher.

Thanks for the responses. I couldn't find any reviews online, but I did find some fairly decent pictures which led me to deciding to order this mount. I figured it's $20, so the loss won't be too bad if it's not a great mount. It should be coming ,from AES, tomorrow so if the weather cooperates this weekend I'll put it to use and then post a small review.

Thanks for the tip about the velcro, I'll be sure to do that.

I'm looking for a source for mounting brackets, like the KlickFix brackets used on these Novara bags:
http://www.rei.com/product/782722

Obviously I could buy a bag and sacrifice it, but I'm hoping there's a better way.

What I'm after, is to use the bracket to mount a pelican 1150 case, containing my radio gear.

Or, if someone knows of something like this that already exists, that would be cool too.. Hard-shell, handle, quick-release.

I'm planning to put the radio, GPS, battery, etc all in the box, with only minimal connectors to the outside.

Thank you sir,

Yeah those ram mounts look nice. I just ordered that same kit based on your recommendation.

Your mic looks like its just clipped to the side of that platform in the pictures, You couldn't ride like that though right? because the mic would drop into the front wheel if you hit a bump or what have you. Where do you stash the mic while en route?

Thanks again!
Christopher Lee.

Some microphone clips have a spring detent inside that "traps" the microphone so it doesn't just flop out. Even a more normal "U" shaped mic hanger should work...
On my TH-D7 bicycle mobile setup I don't use a mic clip, and maybe one day I will find a more satisfactory solution. My ultimate desire is to have a PTT switch of some kind clamped to the handlebar, wired to a small wiring harness that will allow quick disconnect of the radio etc. and allow me to use a modified cell phone ear-hanger earpiece/mic instead of the mobile HT speaker-mike which, in spite of having a strong lexan spring clip on the back, tends to work its way loose from wherever it's clipped. Clint's hook looks like a satisfactory method for the mic with dangling coil cord.
Mine occasionally has gone floppity-bop and while very frustrating to have to pull over and stop and rescue the mic, it somehow has never gone through the spokes and the then-unavoidable self destruction.
Bouncing off the pavement isn't good for my microphone, but at least it hasn't wound itself around the front wheel hub HI :?)
I tend to hook the first loop of my mic's coil cord around my finger or a ridge on the handlebar grip while riding...
I also think the RAM mounts are the way to go. Very durable, obviously designed for real use (They have accommodation for accessing the accessory jacks etc. on the TH-D7 model), and very reasonably priced.

I use a Diamond NR770HA on my bike, and have the NMO version on my car. I like it, although it didn't get a lot of good reviews on Eham.net (whatever that's worth). The tilt-over function is useful when bringing the bike inside or parking it at a rack.

http://www.rfparts.com/diamond/nr770hnmo.html

For mounting, since it doesn't need a ground plane, I used the HRKS mount. It is a simple sticky backed mount, but I added a few self tapping screws to beef it up.

hi jeff,
sorry for all lower case - recent surgery :-(depending on the design
of the luggage rack, you might be able to use a trunk lip mount. the one
that i used has 4 set screws that hold quite well. a homebrew approach could
be two flat aluminum strips, one longer than the other. the short one could
be underneath the rack and long enough to span beyond the rack width on
both sides. another longer piece on top of the rack long enough to span
beyond the rack width on one side and enough length for the nmo on the other.
i'm guessing at 7
' or so for the lower strip and 9" for the upper. through-bolt in at least
two places so that the upper strip squeezes down and the lower strip
squeezes up to act like a clamp on the rack. i'd use maybe 1.5" - 2" width and
perhaps .188" - .250" thickness. _www.mcmaster.com_ (http://www.mcmaster.com)
is a good place to get such things in shorter homebrew lengths. biggest
harware store in the world from what i've been able to see, and riendly to
small orders.

best,

I've had success with mounts designed for truck mirrors. I've used two over the years and find them easy to attach to my rear rack; the rods used by the racks are close enough in diameter to the tubing used in mirror mounts. The mounts are available at ham radio stores and large hamfests; you can get them with 1/4 screw, NMO, and various other sorts of antenna connection.

You can attach it either along one of the sides (which can interfere with panniers depending on position) or at the back (which interferes with mounting a reflector).

1954. Article on the History of Bicycling

Yahoo group: BMHA
Date: 2009-04-20 23:11:07 UTC
From: Mike Nickolaus
Topic: 1954 Message: 1954

I found this article on the History of Bicycling on the crazyguyonabike.com website and found it interesting to read. You will notice the very first bike called the "Hobby Horse" running machine looks similiar to our BMHA Logo. For those interested in reading these articles here is the link:

http://www.crazyguyonabike.com/doc/page/?o=3Tzut&page_id=40616&v=9R

By the way, crazyguyonabike.com is a pretty good website containing thousands of bicycling touring journals, articles on touring, reviews of bicycling gear and many other articles of interest. The site if totally free and you may find it interesting.

Jerry,

This would be a great opportunity for a newsletter story. I'm especially interested in your use of a 706. I' too' have one and it uses 1.5 amps at idle.

Speaking for myself, I'm very interested in the entire setup.

73 de Scott/n7net

Look at the spring newsletter from last year or the pictures in the new newsletter when posted. I wrote an article on how I built my setup. Both the track and road bike will be at Dayton again this year if you want a closeup look.

1960. Re: 2/440 mount

Yahoo group: BMHA
Date: 2009-04-24 15:08:31 UTC
From: W1RO@aol.com
Topic: 1960 Message: 1960

One of the local hams simply took a piece of metal 8 inches long, 2 inches wide, 1/4 inch thick and bolted (2 bolts) it to the bottom of his rear bike rack. It extends directly behind the center of the rack about 3 inches. Then he just mounted the NMO mount using the same method as a car roof mount. He ran the coax forward under his homebrew mount until it was under the rack. Under the rack he doubled the coax back the entire length of his rack to allow decoupling of the coax. Much like the decoupling a home station vertical. He used zip ties to hold the coax to the rack.
Good Luck

1961. The latest newsletter and information for Dayton

Yahoo group: BMHA
Date: 2009-04-25 21:20:45 UTC
From: slafetra
Topic: 1961 Message: 1961

The latest newsletter has just been sent (via email) to the BMHA member list. As a membership incentive, we will give this a week of "first delivery" and then publish the newsletter on our website at http://BMHA-Hams.org.

Lots of good stuff about Dayton and the bicycle ride which is planned.

After May 5th, you should see the newsletter on the website and a pointer to it here on this forum. Or, if you are already a member of BMHA (see the registration form at http://BMHA-Hams.org/Info/Info-MembershipApplication.htm -- it is free), you should have the newsletter in your mailbox by the time you read this message.

The weather here is California is beautiful. I don't have time to ride today, but I sure wish . . . . It doesn't get much better.

Sorry I'm still laughing at this statement"The weather here is California is beautiful. I don't have time to ride today,
but I sure wish . . . . It doesn't get much better."

Why am I laughing at this? Well in Box Elder(near Rapid City) , South Dakota its been snowing since last nite. We have about 6 inches of snow now and its still coming down.

Last time I checked isn"t this near the end of April, isn't this Spring time. Sorry to waste your time reading this but their isn't going to be any bike riding today, darn it.

Thanks for helping to lighten my day.

Yes, California weather can be nice -- not a cloud in our pure-blue sky today.
Unfortunately, we are going through some very intense times at work (I'm involved in releasing Windows 7 on our home computer product line) and I just don't have time to ride.

Darn. You have the time and not the weather. I have the weather and not the time . . .

Cheers, all will eventually work itself out.

And for the entire group -- enjoy Dayton. I'd like to be there, but will not be able to attend.

Topic: 1966 Message: 1967

Wow, Ken...there's so much I wanted to say during your survey.

You touch on a very important concept: COMMUNICATION. When I give my amateur satellite talk across this region (So CA), I usually join the club I am speaking to. Not necessarily because I can attend every meeting and help with every event ... but, as a p.r. kind of person, I want to see how they treat their members. And how they retain membership.

After almost twenty such memberships, only ONE CLUB actually took the effort to WRITE a personal card/letter to me, asking about renewing my membership.

Oh, a few included a "renewal plea" in a newsletter. And that seems to be the only way some clubs communicate with their members.

But that "personal touch" club got my renewal fee.

Good work on the survey, Ken. Hope to see a synopsis of your results here in a couple weeks!

1977. Dayton Hamvention BMHA Forum Reminder

Yahoo group: BMHA
Date: 2009-05-07 16:52:24 UTC
From: Mike Nickolaus
Topic: 1977 Message: 1977

Just a reminder of the Dayton Hamvention BMHA forum coming up in just a little over a week. Here are the details again. Remember to bring your bicycle setup for diaplay and demonstration at the forum.

==========

Date: May 17, 2009
Time: 9:15
Room: Room 4

The 19th annual BMHA forum is set for Sunday, May 19th at 9:15 am in Room 4. Mike Nickolaus, NF0N, is our forum moderator this year.

Our main theme this year is "Display your Bicycle Setup" and we are encouraging everyone to bring their setup and display at the Forum. We will set aside at least ½ of the forum time for attendees to roam the room and ask questions, take pictures and learn about how others have setup their bikes with VHF/HF gear and antenna systems. If anyone would like to present pictures or audio, we will have the necessary viewing equipment available. Bring your CD/DVD or presentations on removable media. Computer equipment will be supplied.

There will be a short BMHA business meeting and a presentation of some very interesting antenna design for both bicycle and pedestrian mobiles along with audio of some long distance bicycle and pedestrian QSO's. This is from one of our international bicycle/pedestrian friends, G4AKC, and I will try to present as best I can his information.

Our web newsletter editor, Norm, N9ZKS, will present some of his ideas for the upcoming newsletters along with his special bicycle setup.

Arnie, KA0NCR, will review the Hamvention Bike ride from Saturday. Renewal of the Dayton BMHA bicycle ride is planned, see details elsewhere in this group messages for details. We are hoping for good cycling weather and to meet many of you on the ride. Arnie, KA0NCR, has volunteered to coordinate the BMHA ride.

1981. Dayton Hamvention BMHA Forum Room Change

Yahoo group: BMHA
Date: 2009-05-08 14:27:10 UTC
From: Mike Nickolaus
Topic: 1685 Message: 1981

Looking at the website, the Dayton Hamvention appears to have changed our Forum Room from Room 4 to Room 5 for our forum. They also list the start time of 9:30. Be sure to look at the program for the forum room and start time. If it is Room 5, I don't see any forums prior to our's, so I am sure we can assemble earlier than 9:30 with no issues. Feel free to come into the room and setup your bicycle display as early as you want, I hope to be in the Room well ahead of the start time.

BMHA Forum Moderator

1982. BMHA Bike ride and forums at the Hamvention - Come on out!

Yahoo group: BMHA
Date: 2009-05-10 15:14:52 UTC
From: Arnie Grubbs
Topic: 1982 Message: 1982

Hello everyone,

I'd like to remind everyone who is going to be at the Dayton Hamvention this Saturday and Sunday about the the BMHA forum Sunday morning, and to invite everyone out to the BMHA bike ride/get together on Saturday afternoon.

NOTE I beleive that the room has changed location again, be sure to check the posted room schedule at the Hamvention!

If you are BMHA member or not, stop out at the trail head and say HI!

If you are a HF-Pack person stop out too, Plans are to have an "I-ball" QSO time and photo shoot
at about 6:30 and then something to eat afterward - at about 7 PM - at a restaurant just across the road from the trail head.

After checking on the roads and trails in the area, it was decided that a bike trail ride would appeal to more
riders as it would have a good surface and would not have us riding in traffic, although you will have to cross
a couple of streets if you ride to the ends of the trail.

Out of all the trails, it looked like the best one for us would be the Wolf Creek trail. The trail has very gentle grades, and is 12 foot wide asphalt so road bikes need not fear gravel trails.
For more info, check out the trail website at:

http://www.miamivalleytrails.org/wolf.htm

We will be starting Saturday afternoon 4 PM local time at the Brookville trail head . We felt that this should give people a fair amount of time all day Friday and Saturday morning and part of the afternoon to
check out the Hamvention, while still giving time to get to the trail head.

The ride length and speed will be left up to the individual rider’s preference. You can even just set up your bike
at the trail head and operate and not ride if you desire, or if the weather looks threatening just hang around
near the car at the trail head and have a few “Eye-ball“ QSO‘s and photo op's.

If the weather goes along, the trail should provide about 25+ miles of travel for those of you who wish to ride to each end.

We plan to start at the trail head at the intersection of Arlington Rd and Upper Lewisburg Salem Rd, which is just
off I-70 exit 21 at Brookville. This trail head has parking, and several places to eat near by. It is just across the
street from Rob's Restaurant and from what I am told it is great and that it is frequented

by the local bike club on
their Saturday morning rides.. so that sounds like a great endorsement to me! We can plan to chow down at
Rob’s after the ride.

We plan on gathering the group after the ride back at the trail head, at about 6:30. At this time we
hope to take pictures and have "eye-ball' qso's and to check out everyones "rolling ham shack".

The easiest way to get to the trail head from the Hamvention is to go west a few blocks from the Arena to Salem
Ave. and then head north to I-70. Proceed west on I-70 to Exit - 21. Take the off ramp, go south over the
Interstate and proceed 1 block south to the trail head at Golden Gate park. The trail head will be on the east
side of the road just before you cross the Upper Lewisburg/Salem road way.

I hope that you will stop out and enjoy the trail and meet up with some of the BMHA people, and HF-packers!

1983. Hello from G4AKC

Yahoo group: BMHA
Date: 2009-05-26 07:43:14 UTC
From: davidandtracy
Topic: 1983 Message: 1983

Hello all, just thought I would make a post to say how pleased I am to join the BMHA; many thanks to Skip and Mike, NF0N for welcoming me into the group.
I am keen to set up possible skeds with anyone who has HF bicycle mobile station with the intention of bike to bike contact, probably on 20M or 17M.

Please let me know.

73's ...

Dave,

Welcome to BMHA and our group. For those who want an additional introduction to Dave and his bicycle and pedestrian mobile activites, the current June 2009 issue of CQ magazine, Page 62 has a great article about Dave along with other bicycle mobile ideas. Dave Ingram, K4TWJ, has done a very nice job of promoting bicycle mobiling.

Now, let's see who is the first BMHA'er to make contact with Dave, G4AKC.

Mike, NF0N

Hi all,
I'm trying to decide on a front headlight so I'm not necessarily forced to return home before dusk. I've seen any number of options on the web, but I wonder what lights you like/dislike. And if you have any homebrew thoughts, I'm not at all averse to whipping something up that can run from my 12 volt ham ops battery especially if it results in plenty of light. Thanks!

By having an independent power source I don't have to curtail my radio time in order to have enough current left to get me home. So, I bought an Energizer headband light from the Walmart camping section. It requires three AAA batteries to operate two, four, or six LEDs (my choice with a step switch) and it pivots to allow the light to be focused almost anywhere (I've even read a book using it). The builder claims up to 40 hours on one set of batteries. I think it cost about $12.

I used several lights and then landed on Dinotte systems with the brightest I could get. A bright and attention getting rear light is as important as the front lamp. A good rear lamp will be as useful in daytime as at night. See and be seen .. wear lots of reflective bits .. around your wrists so arm motions are visible, around ankles ..

I, along with my daughter and husband in Berlin, have the:

Cateye Ld-1100 Tail Light

which costs $40 at Nashbar.

It works well enough to hurt your eyes.

The feature we particularly like is that you can attach it to your
bike or yourself and take it with you when you leave the bike.

Best,

From: jimdevenport
Topic: 1988 Message: 1992

I too like the headlamps available in a wide variety at most hardware stores. The ones I like best have super bright LED's and can be selected for low, medium, and maximum brightness, and one more click after that it BLINKS, on the bright setting. I mounted mine permanently on my helmet with black plastic zip ties, and I mounted a red blinky LED tail light on the back of my helmet, so the front is flashing white with the headlight and the rear of my head is flashing red with the tail light. I also have a flashing red LED tail light attached to my bike pack that straps behind me on the rack where the J pole is also side mounted. Over time I've decided the expense of replacing batteries every 2 weeks or so is worth the visibility, so I run all lights day OR night, as well as wear one of the ubiquitous day-glo green vests with silver reflective strips. All that, plus the 6 foot fiberglass flagpole made into a J pole flopping in the breeze, may make drivers shake their heads and think I'm an idiot but at least hopefully they see me.
I run my radio (TH-D7) and GPS and APRS stuff off a homebrew 12 volt C cell pack in one of my panniers but still run all the blinky lights from their internal batteries.

My Dinotte lighting uses rechargeables so when I get home, I hang the bike by its rear wheel, disconnect each light and connect each battery pack to the charging cable. I have a power strip with the two 'wall warts' permanently mounted on the wall where the bikes hang. Yes, I use separate battery packs for the two lights but could run them from one.

You might want to check out this site:

http://www.nordicgroup.us/s78/

They have plans for do it yourself brackets to mount flashlights on a bike, and they also recommend one from Lowes that uses a high power led powered by 2 c cells:

Well, there's nothing saying that a light needs to be on TOP of anything including a handlebar if that's what you mean. An under handlebar mount can be just as effective and also be out of harm's way. I've also seen some fork mounted lights in the past.

Indeed, a light mounted on the fork will work. Fifteen years ago, when I commuted to work, I somehow acquired a mount that clamped to a fork blade. I used a wheel generator and mounted the head lamp as close to the generator as possible and cut the wire to length.

It worked.---

I had a light on my '85 touring bike fork for several years.

Actually, it was mounted on an aluminum arm extending from the top of
the front left pannier rack.

The generator was mounted between the chain stays.

I used it on six cross country trips.

The thing I appreciated was the head was far enough away from my eyes.

As a result, I seemed to be able to see better.

2000. Antenna Feedline

Yahoo group: BMHA
Date: 2009-06-07 13:29:02 UTC
From: craryn
Topic: 2000 Message: 2000

I realize with some antennas the length of the feed line is critical for their efficiency. What about a vhf/uhf with NMO mount? Can I cut the feed line to a couple feet for a bicycle application without affecting the operation? I have looked and cannot find anything on this.

As you said, it depends on the antenna, not the type of mount. More data
is needed.
Best source of information would be the antenna manufacturer. They do
have various length feed lines available, perhaps it would be best to
get the length closest to the length you need.

As with the vast majority of antennas, a simple V/U self resonant antenna will not be influenced by any particular length of feedline.

2003. Re: Antenna Feedline

Yahoo group: BMHA
Date: 2009-06-08 15:25:18 UTC
From: jimdevenport
Topic: 2000 Message: 2003

On both my bikes I now have RG-58 cables with BNC connectors zip tied to my upper frame tube semi permanently.
I normally mount the TH-D7 and Magellan Gold GPS on my front handlebar stem with one of the new stainless steel hose clamps with a plastic tab attached so I can tighten or release the hose clamp by hand.... I don't dare leave any electronics unattended on the bike.
The homebrew J pole attaches to the BNC cable via a female-to-female adapter. I used to just fold up the J pole's feedline and zip tie it to the bike, leaving sufficient cable slack so I can lay down and tie off the antenna while on the car rack... but any time the J pole required maintenance I had to cut the zip ties, undo the cable, etc.
Now with the adapter at the back I can just release the BNC adapter and remove the antenna..... plus the added advantage when it's raining out, I plop the radio/gps bracket into the rear pannier where it stays safe and dry..... and the short stub from the J pole can be attached there at the rear of the bike without having to undo cable bundles, cut zip ties frantically in the rain, no additional details needed. I notice no difference whether the electronics are up front on the end of the longer BNC cable or in the pannier on the short BNC cable. As well it should be....
The main concern with VHF/UHF antenna cable is the loss, which increases with cable length. At the lengths involved with bicycles and mobiles, generally less than 20 feet, the loss is minimal.
As the previous poster stated, if your antenna is anywhere near close to being properly adjusted the cable length will not affect it further. If your antenna has an SWR of over 2 to 1 or so, the antenna should be adjusted, not the length of the coax.

Hardly a problem when comparing, say, the 17 feet of cable that comes "normal" on those NMO Radiall-Larsen kits and, say, whacking it down to 8 feet or so ... But definitely not true when comparing 17 feet to 100 feet of cable, of course.

Another factor - the user's proficiency at soldering the connector if the "standard" cable length is shortened.

From: W1RO@aol.com
Topic: 2005 Message: 2005

I've always made the feedline long enough so I can double it back on itself to cancel out any feedline interaction. I usually doubleback about 19 inches. On my bike that fits nicely under the rear rack since I then run the coax forward wrapping it around the horizontal bike frame until I get the the handle bars.
Some have said this is unnecessary however, I have gotten better signal reports with 5 watts from bicycle using a dual band 18 inch vertical than my previous installation where I did not doubleback the coax.
As we know all installations are different which for me trial and error has produced better results in the end.
Good luck

As you said, it depends on the antenna, not the type of mount. More
data

is needed.

Best source of information would be the antenna manufacturer. They do

have various length feed lines available, perhaps it would be best to

get the length closest to the length you need.

As with the vast majority of antennas, a simple V/U self resonant antenna

will not be influenced by any particular length of feedline.

>> ... to power my rig with 12v battery. What id the best way to do this?

Instead of using the relatively delicate jack on the top of the rig, I'd use a Batteries America CBE-173 - a battery eliminator housed in an empty dry cell case.

http://batteriesamerica.com/icom1.htm

Whack off the cigarette lighter plug and replace with Anderson PowerPoles.

Thanks, I do have a battery eliminator attached, looking for some 12v batteries that give some long live. mounting rig on board my recumbent trike asap.

Latecomer here, but: Isn't feedline length a method for dealing with antennas that have an impedance (when tuned to resonance) that is significantly different from that of the feedline?

I've always understood the proper approach to be: "First tune, then match". Some of the comments previously seemed to indicate changing the antenna off resonance to satisfy the VSWR, but the actual loss to even relatively high VSWR isn't all that large. I've seen discussions on repeaterbuilders on using 75 ohm hardline with 50 ohm systems, based on the idea that on long line lengths, the lower loss of the 75 ohm cables outweighs the impedance mismatch loss.

2012. Re: [BMHA] Has anyone used this solar panel power supply?

Yahoo group: BMHA
Date: 2009-06-09 20:03:26 UTC
From: David VanHorn
Topic: 2009 Message: 2012

Just plug this in the search box: Xantrex 852-2071

It's a 5W solar panel with 10AH gel cell, plus 400W inverter, weighs 18#.
All in one package, which is nice. It's 18#, which is somewhat not nice.

So, charge rate is going to be less than 0.3A, and you might get 8
good hours in a day, so 2.4AH/Day.
(a 5W panel is 5W under absolute optimum conditions, kinda like MPG
going downhill, with a tail wind.)
If your use is very light, this makes a good combination. The solar
cells are probably just dumped into the battery through a diode, since
a 0.3A overcharge is very tolerable for Lead acid cells.

Four of these: http://www.all-battery.com/polymerli-ionbattery37v11000mah7872185.aspx
at 0.5# each,
Plus one of these:
http://www.all-battery.com/protectioncircuitmodulepcbfor148vli-ionbatterypack4cellswith65a
limit-lipcb14v4.aspx
Plus a solar panel
http://www.all-battery.com/solarchargercoleman300ma45wcl-300.aspx

Seems like you could do much the same thing, without the inverter, at
about 4# or so.
The charger would take a little more looking, All battery does not
seem to have one that runs from DC input.

--
There is no computer problem which cannot be solved by proper
application of a sufficiently large hammer.

From: CSM(r) Gary Huber
Topic: 2000 Message: 2013

Odd multiple quarter wave antennas need a ground plane or counterpoise to work against so they may be dependant upon their feed line length in bicycle applications. Half-wave and 5/8ths wave antennas tend to be ground independent and may tolerate feed line modification. However one must consider the possibility that the feed line may be an impedance transformer in some applications and need a specific number of quarter wave lengths at the operating frequency using the velocity co-efficient of the cable.

And a standard steel or aluminum bike frame is not a legitimate counterp
oise? Maybe it's ~ 0.5 - 0.75 wavelength on 2 meters depending on how you
measure it and what accessories are in place, but it's still there.

WHOOPS
Better think about this one.. Maybe it could be a 2-legged counterpoise (~19" in each direction from the antenna base IF mounted in the upper center of the bike frame...) a rather uncomfortable arrangement when you're in the saddle, with it softly rubbing your belly.
Most of us hope to operate the radio while in motion, meaning the antenna has to go on one end of the bike or the other.... where there's really no counterpoise at all. They'll all work, after a fashion, no matter where the antenna is mounted... but ideally it would be an antenna that is not so dependent on a ground plane to couple well. Thus the emphasis on half wave antennas commercial or otherwise. I of course prefer home made J poles made from - a fiberglass Bike Flag Pole - ... helping with propagation AND visibility to bothersome motorists around me.
I have also tried a bike helmet with copper tape for a ground plane inside or outside the helmet, with a 19" stinger on top of the helmet... but silly me, I worry about how the antenna connector is going to feel imbedded in my skull the first time I crash test the helmet. So that was short lived.
W5AOX
(Mine works, see http://aprs.fi/?call=W5AOX-6&mt=m&z=12&timerange=10800)

Unless you're gassing all the time on the rig, it should be ok. What does your HT draw on receive?
The TX draw isn't all that important, if you're not doing alligator impressions.. :)

I'd still look for a way to charge it conventionally, but 3W from the panel (assuming full sun etc) should be more than most HTs pull on receive, so the panel should make at least a little headway when you're not transmitting.

For those who may notice, the BMHA website at http://www.BMHA-Hams.org is down.

We suffered a hardware failure (hard drive crash) and the site will be back up as soon as I can install a new hard drive and recover from the backup. Given my schedule, it may be a few days before this happens.

Hi Andy ...

Good to hear from you ..
I got the brief case style solar panel from Maplin it is a 13 Watt double unit that has a separate 12V regulator which comes with it.
I have removed the internal batteries from the little Yaesu FT-817 and set the RF power down to 1 Watt output, I have also turned the radio panel lights off in the menu on the radio.
I have wired a 20,000uF capacitor across the terminals which would normally connect to the battery from the voltage regulator, this smooths out any voltage variation due to small clouds etc ....
It works fine on 1 Watt as long as we have full sun and I have managed a couple of QSO's across the pond from the bike on 20M ... hope that helps.

Hi again Andy ...

Here is a link to the solar panel I use:
http://www.maplin.co.uk/Module.aspx?ModuleNo=99760

I put the open solar panel into the trailer that you can see in the picture on
www.qrz.com/g4akc and pull it behind the bike.

That's a very small bit of energy storage there. Even a tiny 0.5AH
gel cell or nicad pack would be a lot more effective.
The charge available (in watt-seconds) is 0.5*C*V^2, so assuming that
you can stand two volts of droop, that works out to:
(0.5 * 0.02 * 4) = 0.04 or 40 milliwatt seconds.

Hi David,
I agree but the regulator charger output terminals on the supplied voltage regulator on the solar panels required a battery in order for it to work properly and hence the capacitor acts in place of the battery.
I realise the energy stored is very small ...but in order to claim a totally "green" power source I have avoided using any batteries to power the FT-817 other than the solar panels themselves.

From: barry_bogart
Topic: 2033 Message: 2033

I don't operate bike mobile much as such, but I do routinely ride a bike to remote locations to operate. I like to use a Buddipole dipole, but the mast base has always been an issue - too bulky and heavy to carry on a bike. So I was thrilled to see that I could use my new folding bike as a stable base for the Buddi shockcord mast. With the seat tube inverted and inserted from the bottom, the base can be adjusted so that the mast is close to perfectly vertical. Now I can get set up for HF anywhere in about 15 minutes.

How far out in the boonies? Any particular bands or modes? How important to you are ease of use, antennas, operating time, power source, etc?

By "dual band", do you mean a VHF/UHF HT? Your communications may be limited by distance, terrain, and sparse ham populations away from cities. Although high elevation and a decent whip, external roll-up j-pole hung from a tree, or a small collapsible hand-held beam like the Arrow Antenna can make up for much of that. I really like my Yaesu VX5 HT (I use it for bike mobile sometimes with either a light whip or a bike flagpole antenna) and the new VX8 with GPS and APRS is VERY tempting.

The serious QRP backpackers swear by little Altoids tin-size HF CW rigs and either tuned wire antennas or random wires and a small tuner - check the QRP-L archives and the Adventure Radio Society for ideas. When I went on a bike trip with son's Scout troop (C&O Canal, so no elevation and near civilization), I tried a few evening SSB QSOs with an FT817 and a 12' MFJ telescoping whip and counterpoise + the Elecraft auto-tuner. I was more successful keeping people awake than making contacts! My VX5 came in handy a few nights to get NOAA weather alerts and monitor a wide-area Skywarn net. I didn't rely on it as a cell-phone backup and would have hated to need it for that. If I wanted a good HF self-contained radio and was willing to stick with CW, I'd look at the Elecraft K1 with internal batteries and tuner or the KX1. Hope this helps

Hi Andy,

I have got an Alinco DX70-TH fitted to my bike which is similar to the FT-857 you can see more info on: www.qrz.com/g4akc
I have also got a set up with a FT-817 using only solar panels (without any batteries) on my bike.
I get great results on the HF bands whilst cycling close to the water.
Please let me know if I can help in any way ...

Those are great ... I have 4 or 5 of various designs .. BUT I WOULD NEVER
USE THEM AS A 'BIKE LIGHT'

Yes, at a minimum, it would help folks to see you, but they are no way near
bright enough for me to see the road ahead.

My bikes use .. at a minimum .. a 10 watt headlight mounted on the
handlebar.

To each his own, as they say. I use these same headlamps as bike lamps all the time after dark, and they provide great visibility up the road ahead of me. I like them very much for this purpose.
I used to run an expensive bike light mounted on the handlebars but my dislikes included:
-High cost
-Fixed mounting, could not aim it at anything without swerving the bike
-Vibration caused the light to wobble ahead, and caused problems with the lamp mechanical mounting
-Another widget to have to remove from the bike daily to inhibit theft

With a "Wal Mart" type headlamp, it points where I look, comes inside with me, is protected from vibration by being mounted on ME instead of the bike, easily used as a regular extra bright flashlight, etc, etc.

On my Sun EZ-3 USX recumbent trike, which has underseat steering, I have no alternative but to use a head-mounted lamp as a bike lamp. I can and have mounted a regular lamp on the handlebar, but due to its low location, it's not very effective. The headlamp worked pretty well.

To keep this somewhat on the topic of radio, underseat steering kinda rules out handlebar mounts for HT's.... The HT will be awfully close to the ground.

To keep this somewhat on the topic of radio, underseat steering kinda rules out handlebar mounts for HT's.... The HT will be awfully close to the ground.

2041. APRS bike-mobiles?

Yahoo group: BMHA
Date: 2009-06-22 19:51:21 UTC
From: jimdevenport
Topic: 2041 Message: 2041

I'm looking for BMHA guys running APRS on their bikes regularly that I can track....
I'm interested since I commute 12 miles across Albuquerque almost daily running my TH-D7, Magellan Gold, and homebrew J pole.
I had a list of a half dozen hams who showed up at various odd times as bicycle mobiles -- all but one have dropped off the map, literally.
The only ham I see biking regularly nowadays is KG0W-12.
If any of you are reckless enough to send me your bike-mobile APRS call so I can track you via aprs.fi I'd appreciate it.

>
Bit slow responding, haven't checked the email in a while...

I occasionally use my 857 on my recumbent bike. It's a heavy combination! But can be fun. Not sure how long it would last you, though - the battery is the big issue.

I have a 12AH AGM battery I use, it's most of the weight. Might be better with a pack of NiMHs or something, haven't done that yet. It lets me run 20W or so, but not sure it would be happy with 100W at all.

I also worried about the beating the relays and such take in the 857. I can hear them "click" occasionally on the harder bumps while riding. So far so good, but...

The most bizarre thing is that the ATAS-120 will actually auto-tune on all bands, including 40M, hanging off the back of my bike! :-)

I took some pics back then when I was setting it up, they are here:

In BMHA@yahoogroups.com, "Joe Martine, N5USR" <n5usr@...> replied to Andy KF4SWS

How does the Battery hold up when the FT857 requires 22A to operate (I think that's right)... I have a Catrike recumbent tadpole trike, so the weight of a battery pack is not that important. So what kinda battry pack would allow best performance and for how long. Do you use a solar charger? I understand the ATAS120 works 2-160M does that mean you plug into both antenna ports on the back of the FT857? Do you use Twitter? See my Blog ajelliottjr.blogspot.com you may email directly if you will. Thanks. Andy KF4SWS

From: Mike Barnes
Topic: 2041 Message: 2046

Jim,

KC5N-9 is a dedicated 'bicycle mobile' Big Red Bee running 5-8 watts APRS 100% of the time
I am on my recumbent (KC5N-7 is my car, KC5N-1 is my iGate station). I usually ride 1-2 times a week for longish (50+) mile rides on trails with an FT817ND/Z817 Autotuner mounted in the middle of the handebars. Antenna Farm in the back consists of Hustler 2m whip (for APRS), 2m/70cm whip (for FT817) and HF antenna de jour (either MP-1 or hamstick).

Of the trails I ride, only one (the Cardinal Greenway near Muncie, Indiana) has an iGate station that relays well to aprs.fi. Lots of places in rural Indiana have poor digipeater converage and poor aprs.fi relays.

I also have an iPhone mount on the bike (with switches to share a modified cell phone headset between it and the 817) for cell phone calls. I have iBCNU which is a program that uses the iPhone as an APRS link and creates APRS entries (which go to aprs.fi) without the use of an actual ham radio (using the GPS in the iPhone). I haven't used that on the bike (but it's very handy for Skywarn work when you are out of range of a digipeater). But if anyone has an iPhone and wants to create APRS entries from a bike, it's an option.

73,

Mike KC5N

Topic: 2041 Message: 2047

Jim & BMHA,

I am planning to rebuild my APRS setup to mount to the bike. I was testing a setup in the car last year around this time, to be used for our local MS-150 ride in Central Missouri. If you search my call at aprs.fi, you will find my tracks (great website, btw! Best one to date for lookups!). I will bring that same setup with me for this years MS-150 ride. I am registered to help volunteer again. Right now, spare time is lacking...too many projects and not enough time for them. I am not willing to sacrifice my sleep, either!

The bike setup would use the NEMA string data from a handle bar-mounted Garmin eTrex Legend (so I can look at the map display while riding) and that would feed a Bionics III that is connected to my FT-530. The test antenna will change from a commercial half-wave to a homebrew J-pole I have used on the bike for voice/repeater contacts. Battery from a SLA battery (I have many to choose from in the shack for the size and weight requirements for a 2-hour ride to a week long-cross state jaunt). I am looking for a nice container, and I think I may go with the see-thru waterproof boxes one can purchase at Wal*Mart in the sporting goods section. May build a multicell pack for that container.

The Automobile setup uses a hockey-puck GPS receiver, the Bionics, and a cable to plug into the TM-V7A I use for mobile work.

Perhaps I will find a few hours to get my bike APRS project up and running (since Jim has tossed down the gauntlet!). I want to see how well it works in my area near my house, since we are pretty hilly around here. I am lucky to have a digi (K0STL-3) right near my QTH. I will post an update when I get it running.

Does anyone know of some good websites that features bike mobile APRS that they want to share?

Does anyone here know of a source for the four-pin 1/8" connector
commonly used on Iphones?
I have a bluetooth headset that I'd like to adapt to my D7A.
I figured on using a hardwired TX switch, and then taking the audio
from the D7 in and out of the bluetooth module, and mixing in audio
from my MP3 player when the D7 isn't active. I do like the idea of
not having any cables between me and the bike.

I just went through this exercise for my bike. Newark carries 3.5mm
4 pole plugs. I have never found a source for the jacks-- if you find one
let me know.

For my bike, I needed a connector (plug) between the iPhone and a switch
box with a multi-ganged switch which connects either the iPhone or the
radio. I ended up finding a cheap iPhone earbud headset clone and just
clipped off the 'buds' and used the cable and the plug. I wired the other
end of the cable to a regular 3 pole plug, connecting the left and right
channels since the headset on my bike only has one ear piece (and thus
avoiding needing a 4-pole jack).

See http://pinouts.ru/PortableDevices/iphone_headphone_pinout.shtml
for the pin connections of the 4 pole plug.

Female? Sorry, I just read what I wrote, and that's the part that I
managed not to mention.

The bluetooth dingus is a little module that plugs into an iphone, and
the dingus has a 4 pin male plug, which looks like an 1/8" stereo plug
but with one more ring.

That's the issue, the mic audio would get shorted to ground in a
regular 3 pin jack.

From: Ron Baran
Topic: 2059 Message: 2059

Anybody out there in BMHA land doing Bike/Mobile 1C Field Day this year?

Eighty meters was always a problem for me trying to tune a 102" whip and actually get a signal out.

This year - a tandem bike trailer with the seat removed, a 10 foot pole out the seat post with a ham stick dipole and an LDG tuner. A little scary looking and not the most stable of lash ups but I can get the the bugger to tune a fair portion of the 80 CW band.

Class 1C with a goal of 300 CW Qs and 100 miles covered ... and 800mg ibuprofen q6h

Hi Harry,

The mounting bracket is attached to the rear rack and a spring and then the 102" whip. I use a AH-4 tuner between the radio (IC 706) and the whip. Push button tuning on the radio.

The spring mounted whip is the most versatile of the antennas I've used. I virtually destroyed an Outbacker by hitting a tree limb and have snapped hamsticks in half going through an underpass.

The 102" spring mounted whip is the same puppy that would flop around on the State Cop Cars. It clears power lines with room to spare. As you can tell I'm not playing FD right now. Raining here in the Chicago area. And here I set up this great lighting system for night operating while in motion and a tandem trailer with the hamstick dipole for 75 while sitting still. Doesn't look like I'll get to use either.

73

Ron, W9XS, sitting inside waiting for the rain to stop. The WX dudes say the precipitation ought to end around 1AM.

2064. RE: [BMHA] Field Day

Yahoo group: BMHA
Date: 2009-06-28 11:41:14 UTC
From: Ron Baran
Topic: 2059 Message: 2064

Hi Harry,

I use a pair of 12AHr sealed lead acid batteries. I have a saddle bag on the rear rack and one battery in each pouch. The hang down on the sides of the rear wheel so the center of gravity is low. Those batteries will give me around 2 hours of contest operating at 100W.

After two hours I'm ready to come back in, suck a Corona, put the logging info from the digital recorder onto my spreadsheet, alphabetize the calls, print out a dupe sheet and stick it to the handle bars and off for more FD fun.

Yesterday it was in the mid eighties but the humidity was only in the 50s.

Eat a big lunch. You have antennas to take down later!

Subject: Re: [BMHA] Field Day

How do you power your 706? They get pretty hungry!

I worked at our FD site (Kankakee) today, erecting 7 antennas. However,

the heat took its toll on me. After eating some lunch, I stayed home.

We did get some light rain at about 10:00 PM.

73,

Harry, WD9FYF

Yes, but they are nowhere nearly as bright as is needed to see the road
ahead. Yes, they allow you to be seen but not to see (at least with my eyes)

Took the Trike (Trice XL-NT) and antenna trailer and set up in the local park. Operated for about 3 hours with the 5 watt FT-817, modified Buddistick (part Buddipole and part Buddistick. longer mast with radials).

Made some nice contacts on 20 meter CW and a few on 40. It got pretty windy so took it all down before wind did damage to antenna and went home.

As it was a few years ago when I did this, many people were out in the park walking and visiting. The Police cruiser went by 5 or 6 times and no one, not even the Police stopped and asked what I was doing. I guess I am invisible or all the curious people are gone.

Great weather for this years Field Day in Nebraska, windy but temp was in the low 70's.

2068. Re: Field Day

Yahoo group: BMHA
Date: 2009-06-29 13:01:27 UTC
From: Mike Nickolaus
Topic: 2059 Message: 2068

Jeff,

Yes, I have uploaded a few pictures in the Photos section of this group, the albumn name is: NF0N Field Day 2009.

I have a Burley Nomad trailer with the rack accessory on top and have fashioned an alumunum plate about 20" x 15" that is bolted to the top of the rack. The plate has holes for both UHF and 3/8" mounts. I used a 12 amp hour battery to power both the radio and computer. This was the first time I had used the DC power cable for the computer and found it would generate hash on the radio about an S9 level. Removing the DC supply and used just internal battery power solved it for the time. The internal battery on the Dell Mini-9 lasted for the time I ran FD nicely.

The vertical antenna was a Buddistick with the addition of two sections of mast from a Buddipole. Including the coil I think the height of the vertical was approximately 12 feet. It worked nicely on 20 and 40. I layed out 2 counterpoise wires using the mounting bolts on the trailer top plate.

I ran only CW using the Palm Paddles with a magnetic base and had a small metal plate that it set on. This gives it enough weight and does not move around while operating. My tuner is the Elecraft T1 and works nicely with the Yaesu FT-817.

As the pictures show, I setup on a picnic table at the park, a nice concrete one in the shade and used the trailer mounting for the antenna. I live about 2 miles from this park and had everything loaded in the trailer and rode to and from the park. I suspect all the equipment including the batteries weighed about 35 pounds which fit's nicely in the trailer.

If anyone want's more detailed pictures of the trailer mounting and close up of it I can supply more pictures. I am not a detailed person on this type of equipment, I usually make something work somehow and then use it if it works.

2070. Re: Field Day

Yahoo group: BMHA
Date: 2009-06-29 13:46:53 UTC
From: Scott Laughlin
Topic: 2059 Message: 2070

Jeff and Mike,

With temperatures beyond 100 degrees in North Texas I stayed inside on Field Day.

However, I did some bike portable earlier this month using an MFJ-9040 and a 40m hamstick and a U1 battery. I was able to tune the antenna close enough that the SWRs were near 1:1 without a tuner, but only if I kept my coax shorter than 12 inches. That was before sundown and I made only one contact. I'm hoping to refine this setup, so I guess more R&D (a nice way of saying trial and error) are in order.

I wish I owned an 817, but if I do SSB I guess my hungry 706 will have to do for now.

Great photos Mike.

2071. Have Radio Will Cycle

Yahoo group: BMHA
Date: 2009-06-29 15:19:37 UTC
From: Scott Laughlin
Topic: 2071 Message: 2071

I've been retired for a decade, so I have to create my own physical activities. The first thing I do each morning is pedal a varied route that totals five to eight miles. A 2m radio is secured beneath the saddle and connected to a J-pole. Using one Watt, I haunt the McKinney, Texas repeater and chat with those who are out and about at dawn for any number of reasons.

Last spring I was using a J-Pole made of 300 Ohm twin lead. A week before HamCom occurred (June), I found Ed, WA5SWD, a semi-retured engineer who is also a mobile bicycle enthusiast. He challenged me that his antenna was better than mine.

I met him at HamCom and he gave me his antenna which is fabricated from a carpenter's level, copper wire, and coax shield. I had my reservations about it.

It's impossible to test an antenna using a repeater, so I put it on APRS in the back yard, mounted on my bike, using the same radio as mentioned earlier, only I was using four Watts. After accessing Open APRS I found my Gateway was in Anna, ten miles north of my QTH. Then when I switched to Ed's antenna and found my Gateway was now at the Oklahoma border, thirty miles farther.

Needless to say, I discarded my twin-lead antenna and the Ed's antenna is my mainstay.

My bike is a Bike Friday New World Tourst folder, custom built by Green Gear. Perhaps as early as tomorrow morning I'll start towing my Bike Friday trailer along with an MFJ-9420 with an add-on CW board, a U! battery, and a 20m ham stick. I don't do two things well, so I stop and see if I can catch some early birds.

Sounds interesting, are there pictures?

David,

I've uploaded one photo in a new album called N7NET's STUFF. I'll upload more in awhile.

Scott,
The antenna sounds very interesting, albeit a bit peculiar on choice of components!

I would like to see some pictures. We always are searching for a better antenna!

Harry,

Indeed, it is a strange looking antenna, so strange that I was several months getting around to testing it.

Look in the photo section at N7NET's Stuff. The orange carpenter's level provides a rigid spacing between the radiator and the stub. A coax shield has been pulled down over the fiberglass flagpole and serves as a radiator about 3/8" in diameter.

Someone with an antenna analyzer might want to vary the distance between the stub and radiator to see how the performance changes.

Hi Harry,

I'm assuming you're asking how I got away with the antenna? Ed is constantly building antennas. I hear them talking on one of the Plano, Texas repeaters about a new antenna he's finished. He'll give it away and return to the drawing board.

2078. folding bike antennas

Yahoo group: BMHA
Date: 2009-06-30 17:00:41 UTC
From: Barry Bogart
Topic: 2078 Message: 2078

A tandemer and a folder, that's great, Scott. My (our) next bike
will be a Friday tandem, I think (but I have to get that K3
first!). My folder folds sideways, and forms a very
stable base for a mast to use when you are stationary. I
have pix on the Buddipole group. I don't know how your
Friday folds, but if you put the trailer 90 degrees from it,
you might be able to use the seat post to hold a mast. I
think a horisontal dipole will work better for you. BTW I
have a 9406 and it is an amazing performer.

2082. Ideas for APRS and voice antennas

Yahoo group: BMHA
Date: 2009-07-01 21:59:07 UTC
From: BrassRat77
Topic: 2082 Message: 2082

I'm going to be a bike mobile for a century ride (Reston Century in Northern VA) the end of August and want to try APRS again. Antenna performance will be critical, so I am concentrating on that. I currently have a roll-up coaxial dipole I picked up at a hamfest on a flagpole for the voice net and used a long HT whip for APRS. Both rigs @ 5W. I do not want to mount a rack on my road bike, and am trying to keep weight down as it is a hilly ride (approx 6,000 ft of climbing).

Ideas:
- Mount a 2nd flagpole antenna for the APRS. They will be separated by the width of my rear hub. Or use an extra-long flagpole and try to stack the antennas above each other - will probably need metal tubing on or over the pole for the lower antenna and run the coax inside the tubing.

- Use the flagpole antenna for APRS and a helmet-mounted whip as long as I can manage for voice. May need a better antenna for voice, but I won't have to remember to remove my headset when I get off the bike!

- Replace the separate rigs with a Kenwood HT or VX8 with GPS and run APRS and voice off the flagpole antenna. Pricey, but I do get a new rig out of the deal :)

Other ideas would be a stand alone amp like the one Byonics makes (and I'm using a TT3+ for the tracker) to increase power 3dB.

Thanks in advance for suggestions.

73, ride safe!

Steve, I use a homebrew J pole exclusively for voice and APRS (with a Kenwood TH-D7). Very light and very effective, especially if you can elevate the top of the J pole such that the last 38" (the so called radiating half wave portion) is not just coupling directly into your back.
http://www.qsl.net/w5aox/W5AOX%20APRS%20BikeMobile.html
http://www.qsl.net/w5aox/images/JPole_W5AOX_Bike.jpg
http://aprs.fi/?call=W5AOX-6
Fun thing, asking hams about antennas. 6 hams will give you 13 different opinions about what's best.....

From: Scott Laughlin
Topic: 2082 Message: 2084

Steve,

Bicycles move slowly, so a half-hour APRS beacon might provide enough data for you. If that's the case you might consider running APRS only part of the time. How about using a single J-pole and share it for audio with APRS, at different times, of course? That would give you the opportunity to own a XV-8R :-)

2085. Argent data T2/301 on bike for APRS

Yahoo group: BMHA
Date: 2009-07-08 16:47:43 UTC
From: Leigh L. Klotz, Jr WA5ZNU
Topic: 2085 Message: 2085

I've put together an Argent Data Tracker2 on a bike with the following:

Tracker2 FC/301 combination T2/301
http://www.argentdata.com/catalog/product_info.php?cPath=22&products_id=112

Batteryspace.com 1350mAH LiFePO4
http://www.batteryspace.com/index.asp?PageAction=VIEWPROD&ProdID=3784

Pelican P1020 Case
http://www.pelican.com/cases_detail.php?Case=1020

Byonics GPS3 module
http://www.byonics.com/tinytrak/gps.php

Here are photos:
http://wa5znu.org/2009/06/tracker2/

The photos show a 9.6V NiMH pack instead. The LiFePO4 pack is slightly thicker and I had to remove some of the top clamshell padding to make it fit. I stabilized the antenna with bus wire and Rescue Tape, though I'm looking for a better soluition.

Later I plan to add a motion-activated power control mechanism, as I've done before with a piezo element, or, given the proximity to the rear wheel, using a magnetic reed switch:
http://wa5znu.org/2008/11/picaxe-motion-switch/

73,
Leigh/WA5ZNU

Actually I posted a couple videos on YouTube this spring that shows cycling and Ham Radio support communications during the annual GPBC "Spring Fling" bike ride. The audio has an annoying clicking sound which is coming from the camera mount. It definitely needs some refinement.

I stopped most of the noise with a helmet mount camera on my motorcycle
with a low tech cure of a couple of heavy rubber bands to keep it from
rocking on the bumps. I didn't want to lose the flexibility of using the
camera indifferent configurations.

2088. Video - The goat hiker does Bike mobile!

Yahoo group: BMHA
Date: 2009-07-14 19:32:03 UTC
From: Arnie Grubbs
Topic: 2088 Message: 2088

Hi,I thought that I would pass this along as it is a great vidio of QRP and Bike mobile operation, by Steve, WG0AT. Steve is better known for his great video's of QRP hikes with his 2 goats, Rooster and Peanut, but it looks like he's having a great time on the bike too!I met and chatted with Steve for a short time at FDIM this year while the Dayton Hamvention was going on.. Very nice guy to chat with.So, I thought that I would pass along the link to the U-tube video.. Maybe you would want to check out some of his other vids... they are very entertaining!Here's the link!http://www.youtube.com/watch?v=_tknnqTC-7A73 - Arnie KA0NCRP.S. Next week is RAGBRAI, Mike, NF0N and I will be in it, as part of team Megacycle's.This is a group of about 10 hams and a few others doing RAGBRAI.www.ragbrai.org. I will only have VHF/UHF on the bike, but will have the TS-480 in the pickup truck, and will try to get on the air on the days that I have to drive the SAG machine! Probably will be on the higher bands on the voice HF-Pack Freq;s as the conditions allow..

From: Scott Laughlin
Topic: 2059 Message: 2089

Mike, NF0N,

I re-read your activity report of 2009 Field Day. I don't own a BuddiPole or BuddiStick, but I've read about the counterpoise and how they must be suspended abovb the ground. You made no mention of doing such, or if you did I missed it.

Your Field Day experience encouraged me to get serious about some HF. I used an MFJ Hamstick. Not having any test equipment other than an SWR meter left me guessing about what length the counterpoise should be, or how many. And my guessing netted nothing.

However, reviewing your photo again, I spotted the jumper wire connecting your trike and trailer. I tried that. Eureka! The additional chassis provided enought mass that I was able to make a SSB two-way between Dallas and Chicago (or nearby) on 20m using six Watts All my MFJ-9420 could do with the available battery charge). And I did it again the next day. However, it was actually bicycle portable.

It was explained to me that a BuddiStick with radials on the ground reacts as a sloper. But by bringing the radials up off the ground the BuddiStick becomes a vertical.

> I have a Burley Nomad trailer with the rack accessory on top and have fashioned an alumunum plate about 20" x 15" that is bolted to the top of the rack. The plate has holes for both UHF and 3/8" mounts. I used a 12 amp hour battery to power both the radio and computer. This was the first time I had used the DC power cable for the computer and found it would generate hash on the radio about an S9 level. Removing the DC supply and used just internal battery power solved it for the time. The internal battery on the Dell Mini-9 lasted for the time I ran FD nicely.
>
> The vertical antenna was a Buddistick with the addition of two sections of mast from a Buddipole. Including the coil I think the height of the vertical was approximately 12 feet. It worked nicely on 20 and 40. I layed out 2 counterpoise wires using the mounting bolts on the trailer top plate.
>
> I ran only CW using the Palm Paddles with a magnetic base and had a small metal plate that it set on. This gives it enough weight and does not move around while operating. My tuner is the Elecraft T1 and works nicely with the Yaesu FT-817.
>
> As the pictures show, I setup on a picnic table at the park, a nice concrete one in the

shade and used the trailer mounting for the antenna. I live about 2 miles from this park and had everything loaded in the trailer and rode to and from the park. I suspect all the equipment including the batteries weighed about 35 pounds which fit's nicely in the trailer.
>
> If anyone want's more detailed pictures of the trailer mounting and close up of it I can supply more pictures. I am not a detailed person on this type of equipment, I usually make something work somehow and then use it if it works.

From: jimdevenport
Topic: 2090 Message: 2091

I've never heard of nor seen a "Flagpole J-Pole" for bicycles on 6 meters. My design was published in 1984 in 73 magazine for 2 meters and is still in use on all of my bikes:
http://www.qsl.net/w5aox/W5AOX%20APRS%20BikeMobile.html and
http://www.qsl.net/w5aox/images/JPole_W5AOX_Bike.jpg

You could scale this easily to 6 meters, but it would be too long and unwieldy even if you could scrounge up materials for it:
A full J pole on 6 meters would be 156" (THIRTEEN FEET) long... my 2 meter J poles constantly whack trees as I ride underneath them and increases the normal wear and tear from flexing.
If you're hooked on the idea of 6M bike mobile, I'd suggest sticking with the usual quarter wave whip mounted somewhere as high on the rear of the bike as possible, using the metal frame of the bike for at least a partial counterpoise. Keep in mind the typical 5/8 wave 2 meter "gain" antenna works well as a loaded quarter wave on 6 meters. It too will suffer from lack of a decent ground plane but will work and only slightly less efficient than a full quarter wave 6 meter antenna... and can be used for both 2 meters and 6.

In a very recent issue of CQ, there was an article on helical wound vertical antennas. I think just applying the math to calculate the height for 6 m should help you out.

I've been considering 6 m for bicycle mobile as well. I have a good magnetic mount mobile antenna for 6, 2 and 0.7 m bands, but it requires a good ground plane -- not readily available on a bicycle.

Oops! Wrong magazine. It was the June 2009 issue of QST. The article was, "The No Excuses 160 Meter Vertical" It is about constructing a helical wound antenna for 160 m. Should be able to do the math for a 6 meter one and be quite short.

I will keep an eye out for other possibilities.

I realize that this probably isn't helpful in this case, but when the YL and I rode our tandem from Montreal to Halifax a few years ago pulling a BOB trailer, I realized that we could put up a fullsize 6m DIPOLE on the bike/trailer combination with short support 'masts' on the two handlebars and the back of the trailer (with a screen door spring to allow turns). The stoker/operator was right at the center feedline position. Unfortunately we didn't realize this until AFTER a great opening into Europe from the east coast then.

Topic: 2096 Message: 2096

Morning All

My wife and I will be in Louisville this weekend for the Ironman, Beth is running and I will be bike mobile around town and the course. If anyone is in the area and has a freq suggestion let me know so we can get on the air.

I will be running dual band with a FT60 and a comet antenna.

2097. My 2M voice and APRS set up for a century ride

Yahoo group: BMHA
Date: 2009-08-27 01:11:38 UTC
From: BrassRat77
Topic: 2097 Message: 2097

(edited from my post on the Byonics MicroTrak group
<http://groups.yahoo.com/group/MicroTrak/message/1348> with less
emphasis on the MT hardware)

I have uploaded photos of the setup I used to help the Loudoun Amateur
Radio Group provide communications support for a century ride this past
weekend. I wanted keep things as compact and lightweight as possible,
as the Reston (VA) Century ride has about 6,000 ft of climbing, some at
>10% grades. Since the bike is also my regular ride for fast group
rides, I needed minimal changes to the bike and no permanent mods to it.
I have a commuter bike where adding racks, bags, etc. is no problem!
Most of the work concentrated on a better APRS tracker while retaining
my set up for the primary voice net on 2 meters simplex.

Photos are here:
http://groups.yahoo.com/group/BMHA/photos/album/1949487468/pic/list
<http://groups.yahoo.com/group/BMHA/photos/album/1949487468/pic/list>
or look in photos for "KS1G"

I had tried last year to put together a tracker using a TinyTrak3, an
old 5W HT, and a mouse-style GPS packed in a seat-bag. The tracker
worked poorly - it was
heavy, batteries came loose, it was difficult to pack, and when it did
work, very few packets were received by the APRS network once I got a
few miles from
my home fill-in digi or a better local digi. The Byonics MicroTrak 8000
is a compact (1"x5") tracker and 8W transmitter and looked like a better
answer to what I wanted.

The MicroTrak 8000 and a Byonics GPS3 are housed in a plastic Radio
Shack 6x3x2 project box. External toggle switches select on/off and
primary/secondary ID, plus I installed an external charge jack and a 19"
wire as a counterpoise (required to prevent RF feedback locking up the
tracker). 8xAA 2700mAH NiMH cells are
installed internally. Programming requires opening the case and sliding
on a DB9 connector; I may decide ad a jack for serial data for easier
programming.
Tracker board, switches, jacks, and GPS3 are attached to the lid,
batteries to the inside of the case. I used a knife and coping saw to
cut a slot for the
tracker board SMA connector and drilled 2 holes in the lid and one in
the case to make the GPS and tracker status LEDs visible.

The antenna (1/4 wave whip with PL259 mount) is secured with a hose
clamp and 2 zip ties to a strip of metal attached to the back of the
case. A SMA-SO239 pigtail

connects the tracker and provides strain relief. The SMA connection is taped and tied to keep it from vibrating loose. I DO NOT suggest direct mounting of
an antenna, even a lightweight 17" SMA whip - too much vibration on a bike and I destroyed a connector before I learned this! In addition to the counterpoise
wire on the tracker, I added a second wire off the antenna mount. Both wires are zip tied to the bike frame. Since the frame is carbon-fiber, the bike
itself does not provide an RF ground.

Mounting the tracker was my main challenge. I did not want to use a rack on my road bike and needed the seat bag for bike stuff. I modified a Profile Design seat-back two-bottle carrier used by tri and time trial riders. The carrier attaches to the bike seat post and has two mount points for water bottle cages and optional CO2 inflator cartridges. I removed one bottle cage and replaced it with a cheap metal holder (aka "bottle cage"). The holder is modified by cutting off part of the bottle cage, leaving an "L" shape. I installed two bolts on the tracker - one on the back of the case (visible in a side photo) and one on the bottom. Fender washers, a lock washer and nut clamp the tracker to the bottle holder. Anything that can come lose should be secured so it cannot fall into the wheels,
chain , or gears - a crash while in traffic or descending a hill at 40mph is NOT FUN! The bottle carrier holds one water bottle and one CO2 cartridge without interfering with the APRS tracker. I also have room for my seat bag for spare tubes and other bike-related tools.

The mount worked well enough with some field mods. The bottom bolt's lock washer didn't and the nut, washer, and fender washers fell off early in the ride. I later had a problem with the top bolt holding the cage mount itself coming loose. A jerry-rig got me to the next rest stop where I could get tools to re-tighten the
hardware and add duct tape to be sure it stayed put! In the future, I will use loctite, better locking nuts, and probably tape or zip ties to ensure everything
stays put. And try to bring a lightweight wrench or pliers with me. Basically, anything on a bike that can vibrate or shake loose will!

The tracker performance met my expectations given the antenna, terrain, and sparse digi coverage over parts of the ride route. The net control and rest stop stations were able to track me, and I got a nice set of track data from my home UI-View log and from the internet APRS sites.

The tracker's battery life is excellent - I get 24-32 hrs with a 2 minute beacon interval and no other power management. The GPS3 locks on quickly - much better
than a 10 year old GPS I've been using. The only problem I had was with my packaging and rf feedback affecting the tracker. A separated antenna and/or the
counterpoise wires fixed that. A different version of the tracker uses

the metal cover sold with the project case and is much less susceptible to RF
feedback. The MT8000 and GPS3 do a great job and are excellent building blocks for a lightweight APRS tracker.

Voice rig set up was the same I've used the past 3-4 years. A VX5 is strapped to a Minoura handlebar extender used for adding lights or a computer. The antenna feedline is zip-tied to the frame, any excess is coiled and stored in a tt/tri "good bag" velcroed to the top tube. Spare radio batteries and any radio-related tools go in the goody bag or my jersey pockets along with food, ID, and the normal stuff I carry for a long ride (even if I do have a direct line to the SAG support).

The headset ptt button is zip tied to the handlebars so I can ride with both hands on the bars. I'd prefer to place it nearer to the right brifter but the headset-ptt cable is too short. One problem was my Pryme headset (one I've recommended in the past here) fell apart and almost got caught in the front wheel. This is the second one I've destroyed in 3 years and I will no longer recommend them for on-bike-in-motion use. While they have good audio quality and are well-built, the over-the-ear holder has not worked well for me and I'd prefer a longer cord between the headset and PTT. I am now investigating other less expensive wired headsets (the McKay C1LHS in particular) with better mounting as well as bluetooth solutions based on the ideas in August 2009 QST. I will first try a roll-my-own using the connector/cable Tower Electronics sells and a Jabra bt adapter. I may go with the pricier BT unit from McKay or consider a newer HT. The VX8 is tempting and would solve my other problem - how to mount two antennas on the bike.

I would prefer to use a better antenna than a 1/4wave whip on the bike for APRS. Performance (# and location of packets received by the APRS network) is much
better with the j-pole and with a car-mounted 5/8-wave gain antenna. For this ride, however, I needed the better antenna for the voice net and could not mount
a second full-size ground-independent antenna on the bike. The bike lacks brackets for attaching a rack and for practical and aesthetic reasons, I'm not
going to add a rack or seat-post rack to this bike. I'd appreciate suggestions for mounting two full-size ground-independent antennas on a road bike WITHOUT requiring a rear rack or seat-post rack. A longer rear wheel QR skewer (maybe from an MTB?) and some sort of cross-brace to keep the two antennas separated might be all I need. For normal voice work where I can use a repeater (we operated simplex for the century ride), I can use a smaller whip on the VX5 and the large antenna for APRS. An expensive solution would be a VX8 with the GPS and bluetooth headset; that would give me one radio, no headset wires, and one antenna for voice and APRS. Given that costs about $800, I think I can try some other ideas first!

The behind-the-seat water bottle carrier works very well as a mount point for lightweight radio gear once hardware vibrating loose is addressed. Because the tracker's power consumption is so low, I may go to a physically smaller battery, which would allow a smaller case and make mounting even easier.

Hope you've enjoyed reading this. 73 de Steve, KS1G

Steve,

I did a quick read of your post and a scan of the pictures. Nice setup you have built. I gives me some ideas for my APRS bike setup.

I am a big fan of bike flag J-Pole antenna's, using a 300 ohm twin lead and that is taped or "O-ring-ed" to the fiberglass pole. It gets it up high, never needed a counterpoise (though I would get some RF in the bike stereo setup on our tandem).

I looked at your external switch setup. I would probably use some 1/2"x1/2"x1/2" U-shaped AL channel to shield the switches from accidental bumps. Imagine a length of channel and the switches installed in line with the toggle movement longitude to the channel. Just a thought....Would have nice long surface to make a label for the switch options.

2099. Bike APRS

Yahoo group: BMHA
Date: 2009-08-28 02:02:40 UTC
From: Barry Bogart
Topic: 396 Message: 2099

Very interesting. I have done bike-based APRS support myself on shorter events, but as a Randonneur (ultramarathon cyclist), I'd love to have a untralight tracker that will work in the 'boonies' for 4 days (the time limit for the 1200km.75m event is 90 hours). But a solution is not yet in site, even using solar power. Not enough digis (over 750m) is an issue.

I use a kenwood D7 for both voice and APRS. With lithium AA batteries the weight and longevity issues are helped a bit. The D7 has been discontinued but there are rumours about a replacment, and of course the VX8 is another interesting option, but not cheap. D7's might still be found somewhere.... I have also used a VX2 with a TT3 which is ultralight, but doesn't have much range unless you feed it 12v. (As an aside, maybe a hub generator could be helpful - a lot of fast riders I know say they don't notice the drag.)

I use a Larsen half-wave whip which doesn't require a ground plane and radiates very well. I do have a rack on all my rando bikes, though. They are pretty indispensable for extra clothes, food, etc. (on a 90hr ride the weather WILL change!). You could mount a whip on a strut coming off the seat tube. I have seen them for bottle cages, or for more strength you could use the sort used for mounting the rear tandem handlebar on a front seat post. I don't know about esthetics but it wouldn't add much weight nor interfere with the aerodynamcs!

73, and keep the rubber side down.
Barry, VE7VIE/WV2J

My 2M voice and APRS set up for a century ride

Wed Aug 26, 2009 6:11 pm (PDT)

(edited from my post on the Byonics MicroTrak group

<http://groups. yahoo.com/ group/MicroTrak/ message/1348> with less

emphasis on the MT hardware)

I have uploaded photos of the setup I used to help the Loudoun Amateur

Radio Group provide communications support for a century ride this past

weekend. I wanted keep things as compact and lightweight as possible,

as the Reston (VA) Century ride has about 6,000 ft of climbing, some at

>10% grades. Since the bike is also my regular ride for fast group

rides, I needed minimal changes to the bike and no permanent mods to it.

I have a commuter bike where adding racks, bags, etc. is no problem!

Most of the work concentrated on a better APRS tracker while retaining

my set up for the primary voice net on 2 meters simplex.

Photos are here:

http://groups. yahoo.com/ group/BMHA/ photos/album/ 1949487468/ pic/list

<http://groups. yahoo.com/ group/BMHA/ photos/album/ 1949487468/ pic/list>

or look in photos for "KS1G"

I had tried last year to put together a tracker using a TinyTrak3, an

old 5W HT, and a mouse-style GPS packed in a seat-bag. The tracker

worked poorly - it was

heavy, batteries came loose, it was difficult to pack, and when it did

work, very few packets were received by the APRS network once I got a

few miles from

my home fill-in digi or a better local digi. The Byonics MicroTrak 8000

is a compact (1"x5") tracker and 8W transmitter and looked like a better

answer to what I wanted.

The MicroTrak 8000 and a Byonics GPS3 are housed in a plastic Radio Shack 6x3x2 project box. External toggle switches select on/off and primary/secondary ID, plus I installed an external charge jack and a 19" wire as a counterpoise (required to prevent RF feedback locking up the tracker). 8xAA 2700mAH NiMH cells are installed internally. Programming requires opening the case and sliding on a DB9 connector; I may decide ad a jack for serial data for easier programming.

Tracker board, switches, jacks, and GPS3 are attached to the lid, batteries to the inside of the case. I used a knife and coping saw to cut a slot for the tracker board SMA connector and drilled 2 holes in the lid and one in the case to make the GPS and tracker status LEDs visible.

The antenna (1/4 wave whip with PL259 mount) is secured with a hose clamp and 2 zip ties to a strip of metal attached to the back of the case. A SMA-SO239 pigtail connects the tracker and provides strain relief. The SMA connection is taped and tied to keep it from vibrating loose. I DO NOT suggest direct mounting of an antenna, even a lightweight 17" SMA whip - too much vibration on a bike and I destroyed a connector before I learned this! In addition to the counterpoise wire on the tracker, I added a second wire off the antenna mount. Both wires are zip tied to the bike frame. Since the frame is carbon-fiber, the bike itself does not provide an RF ground.

Mounting the tracker was my main challenge. I did not want to use a rack on my road bike and needed the seat bag for bike stuff. I modified

a Profile Design seat-back two-bottle carrier used by tri and time trial riders. The carrier attaches to the bike seat post and has two mount points for water bottle cages and optional CO2 inflator cartridges. I removed one bottle cage and replaced it with a cheap metal holder (aka "bottle cage"). The holder is modified by cutting off part of the bottle cage, leaving an "L" shape. I installed two bolts on the tracker - one on the back of the case (visible in a side photo) and one on the bottom. Fender washers, a lock washer and nut clamp the tracker to the bottle holder. Anything that can come lose should be secured so it cannot fall into the wheels,

chain , or gears - a crash while in traffic or descending a hill at 40mph is NOT FUN! The bottle carrier holds one water bottle and one CO2 cartridge without interfering with the APRS tracker. I also have room for my seat bag for spare tubes and other bike-related tools.

The mount worked well enough with some field mods. The bottom bolt's lock washer didn't and the nut, washer, and fender washers fell off early in the ride. I later had a problem with the top bolt holding the cage mount itself coming loose. A jerry-rig got me to the next rest stop where I could get tools to re-tighten the

hardware and add duct tape to be sure it stayed put! In the future, I will use loctite, better locking nuts, and probably tape or zip ties to ensure everything

stays put. And try to bring a lightweight wrench or pliers with me. Basically, anything on a bike that can vibrate or shake loose will!

The tracker performance met my expectations given the antenna, terrain, and sparse digi coverage over parts of the ride route. The net control and rest stop stations were able to track me, and I got a nice set of track data from my home UI-View log and from the internet APRS sites.

The tracker's battery life is excellent - I get 24-32 hrs with a 2

minute beacon interval and no other power management. The GPS3 locks on quickly - much better
than a 10 year old GPS I've been using. The only problem I had was with my packaging and rf feedback affecting the tracker. A separated antenna and/or the
counterpoise wires fixed that. A different version of the tracker uses the metal cover sold with the project case and is much less susceptible to RF
feedback. The MT8000 and GPS3 do a great job and are excellent building blocks for a lightweight APRS tracker.
Voice rig set up was the same I've used the past 3-4 years. A VX5 is strapped to a Minoura handlebar extender used for adding lights or a computer. The antenna feedline is zip-tied to the frame, any excess is coiled and stored in a tt/tri "good bag" velcroed to the top tube.
Spare radio batteries and any radio-related tools go in the goody bag or my jersey pockets along with food, ID, and the normal stuff I carry for a long ride (even if I do have a direct line to the SAG support).
The headset ptt button is zip tied to the handlebars so I can ride with both hands on the bars. I'd prefer to place it nearer to the right brifter but the headset-ptt cable is too short. One problem was my Pryme headset (one I've recommended in the past here) fell apart and almost got caught in the front wheel. This is the second one I've destroyed in 3 years and I will no longer recommend them for on-bike-in-motion use. While they have good audio quality and are well-built, the over-the-ear holder has not worked well for me and I'd prefer a longer cord between the headset and PTT. I am now investigating other less expensive wired headsets (the McKay C1LHS in particular) with better mounting as well as bluetooth solutions based on the ideas in August 2009 QST. I will first try a roll-my-own using the

connector/cable Tower Electronics sells and a Jabra bt adapter. I may go with the pricier BT unit from McKay or consider a newer HT. The VX8 is tempting and would solve my other problem - how to mount two antennas on the bike.

I would prefer to use a better antenna than a 1/4wave whip on the bike for APRS. Performance (# and location of packets received by the APRS network) is much

better with the j-pole and with a car-mounted 5/8-wave gain antenna. For this ride, however, I needed the better antenna for the voice net and could not mount

a second full-size ground-independent antenna on the bike. The bike lacks brackets for attaching a rack and for practical and aesthetic reasons, I'm not

going to add a rack or seat-post rack to this bike. I'd appreciate suggestions for mounting two full-size ground-independent antennas on a road bike WITHOUT requiring a rear rack or seat-post rack. A longer rear wheel QR skewer (maybe from an MTB?) and some sort of cross-brace to keep the two antennas separated might be all I need. For normal voice work where I can use a repeater (we operated simplex for the century ride), I can use a smaller whip on the VX5 and the large antenna for APRS. An expensive solution would be a VX8 with the GPS and bluetooth headset; that would give me one radio, no headset wires, and one antenna for voice and APRS. Given that costs about $800, I think I can try some other ideas first!

The behind-the-seat water bottle carrier works very well as a mount point for lightweight radio gear once hardware vibrating loose is addressed. Because the tracker's power consumption is so low, I may go to a physically smaller battery, which would allow a smaller case and make mounting even easier.

Hope you've enjoyed reading this. 73 de Steve, KS1G

2100. Shimano Flight Deck brifter button as a PTT switch?

Yahoo group: BMHA
Date: 2009-08-28 18:28:33 UTC
From: BrassRat77
Topic: 2100 Message: 2100

I've been thinking about better ways to install a radio PTT switch on my bike. Ideally, a low-profile weather-resistant button I can attach to my brifter hoods so my hands are always in reach of the brake lever while riding. While riding home from work yesterday, it dawned on me that Shimano has provided such buttons on the inside of each brifter of my bike. The buttons are located on the inside of each hood and designed to be operated without interfering with braking or shifting. I believe the buttons are normal-open/momemtary close SPST. I'm sure voltage and current ratings are low, but so are the demands for PTT for a HT. Shimano uses these to control their "Flight Deck" bike computer. I have to take a look at my brifters to see if the switches are accessible without buying the flight deck wiring harness.

Has anyone tried using these buttons as a PTT switch for an HT?

You'll find that there is a PLACE for a button on each brake hood.
There are no buttons on the brake hoods. The buttons come with the
Flight Deck mount and have to be installed. You could probably find
something that will work if you look around. I've had the same thoughts
but don't have the time or equipment yet for my bike so I haven't really
researched what type of button & circuit board combination 'd have to
come up with.

Drat - you're right! I'd assumed the dimple I was feeling in the brake hood was a real switch when I should have looked first. Still, gives me another idea about where to put a switch and how to protect it from the weather. Or maybe I can find someone with a blown flight deck wiring harness....

Thanks for the pointer, Kelly.

2103. Setting up a antenna on a bike..

Yahoo group: BMHA
Date: 2009-09-04 14:19:49 UTC
From: n1evh
Topic: 2103 Message: 2103

I'm in the process of setting up a antenna on my bike for VHF/UHF. I have a couple of questions.

First... I have a Trek 3700 mountain bike. I've added a Topeak Explorer Tubular Rack (w/o springs) on it. I then cut and put a flat piece of alumunim on the rack. At the end of the piece of aluminum... I put an aluminum "L" bracket that originally had a SO-239 to 3/8-24 adaptor on it and i drilled it out and out a 2" SO-2399 bulkhead barrel on it. I have a Diamond CR627B (6m/2m/70cm tri-band) mobile antenna that I was going to put on it.

Now there was some recent talk of running 6m on a bike... and people talking about how big a 6m j-pole would be. Now since this Diamond antenna is a 1/4-wave on 6m... has anyone tried bonding the antenna mount to the bike (since there is paint between the antenna mount and bike rack and then between the bike rack and bike) to see if a bike would provide an ample groundplane for 6m???

Also... what would you use for coax and... is coax length critcal??? At first I was thinking about using like 10 to 12 feet of RG-58A (it has a stranded center conductor compared to the solid center conductor in regular RG-58)... but then started to think about using 10 to 12 feet of like RG-174 or LMR-100 with either BNCs or SMAs on both sides.

This setup would mostly be used on 2m.

Thanks,

Mike - N1EVH

Try it. I mounted a rack (clamp on) to the seat post of both my road and track bikes. I used metal shim material instead of the rubber provided by the manufacturer. I have DC continuity from the rack to the handlebars with no further additions. It works great with a comet dual band and the co-ax that comes on the regular mounts. (Pictures are available in a past issue of the newsletter.)
One of the things to remember is that there is no "perfect" antenna or set up. If it does what you want it's good. I get into repeaters at 20 miles so I'm happy.

2105. Re: [BMHA] Setting up a antenna on a bike..

Yahoo group: BMHA
Date: 2009-09-04 14:41:33 UTC
From: Mickey Applebaum
Topic: 2103 Message: 2105

There are many points on the bike that you can connect a ground strap to.... seat post binder comes to mind first....

We use RG-174 on my wife's bike with the Icom T90A and a triband (6/2/70) antenna and we have used the 6M to communicate on simplex between us through the mountains without much difficulty.

>>> n1evh<n1evh@...> 9/4/2009 8:19 AM >>>

Topic: 2103 Message: 2106

Mickey,

How much power were you using for your 6m simples? Did you need to use any additional counterpoise?

I've had some modest success on 20m using a hamstick. However, the bike is a Bike Friday folder and lacks enough metal to provide a counterpoise. But by using towing a trailer and using a jumper to connect the two I was able to receive good ssb reports between Dallas and Chicago.

Perhaps I could reach further if I really worked at it.

I've never owned a 6m capable radio. Your posting gives me pause.

With 2m I've used a lot of different configurations on bicycle and motorcycle. I could never be sure what my range was until I began experimenting with APRS and then looking for my gateway. Fifteen miles was always the norm using a modified 5/8 wave or a j-pole fabricated from 300-Ohm twin lead.

Two years ago Ed, WA5SWD, built and gave me a j-pole made of 14gu wire and RG-8 shield for the radiator. By exchanging antennas, mine for Ed's, and staying with the same four watts I extended my gateway from 10 to the Oklahoma border, about 35 miles.

From: Mickey Applebaum
Topic: 2103 Message: 2107

The ICom T90A puts out 5 watts on 6M. We get as much as 6 or 7 miles away from each other when doing the rides through the mountains. Barb's bike is a carbon fiber frame so using it as a ground plane doesn't work, and she's picky about having a big antenna so we have one of the flexible whip HT antenna's strapped to the seat tube. I haven't tried using a counterpoise yet (I do have a tiger tail that I can hang off of the antenna mount at the bottom bracket) since it works well enough so far, and for the most part she hits the 2 meter repeaters without a problem on the big rides (Tour de Cure, MS150 etc) where she's riding her bike as a ride marshall (she was able to hit the repeater on Logan Peak from Weston, ID with a slightly scratchy but readable signal <it's about 20-25 miles straightline>). For most of the rides I am in the Rover with my FT-8900 into a Comet UHV-4 antenna running at 10 Watts. (Yeah, I know.. I need to ride more... I'm barely able to keep up with our team on the Sunday morning "casual" ride that's through the flat parts of Salt Lake City).

>>> n7net<n7net@...> 9/4/2009 12:04 PM >>>

Mickey,

How much power were you using for your 6m simples? Did you need to use any additional counterpoise?

I've had some modest success on 20m using a hamstick. However, the bike is a Bike Friday folder and lacks enough metal to provide a counterpoise. But by using towing a trailer and using a jumper to connect the two I was able to receive good ssb reports between Dallas and Chicago.

Perhaps I could reach further if I really worked at it.

I've never owned a 6m capable radio. Your posting gives me pause.

With 2m I've used a lot of different configurations on bicycle and motorcycle. I could never be sure what my range was until I began experimenting with APRS and then looking for my gateway. Fifteen miles was always the norm using a modified 5/8 wave or a j-pole fabricated from 300-Ohm twin lead.

Two years ago Ed, WA5SWD, built and gave me a j-pole made of 14gu wire and RG-8 shield for the radiator. By exchanging antennas, mine for Ed's, and staying with the same four watts I extended my gateway from 10 to the Oklahoma border, about 35 miles.

Coax length is not a big deal on a bicycle, but the lack of ground plane is. Even at 440 MHz loss is minimal with the usual several feet of whatever coax you choose (of course stay away from miniature stuff like RG-174). RG-58 is a good choice and is what I have used for years on my bicycles.
Even at 2 meters the ground plane is lacking on a bike, and it is of course worse for 6 meters. That said, it should work OK for you, as it has for me and others. One of my most memorable mobile contacts some years ago was between my mobile in Los Alamos and a bicycle mobile IN MOTION in Boston on TEN meters SSB. Of course, the band was wide open at the time, but this guy was running the same radio I was (A Radio Shack HTX-100 or whatever their first 10M radio was) on his bike with a lead acid battery and a full quarter wave CB whip. No grounding other than the bike frame. Sounded great. When the band is open, or you are in local range of other stations on 6, it will work for you without heroic grounding efforts.
If you doubt your metal parts are electrically connected via the screws etc. tightened on a painted mounting point, check it with an ohm-meter for conductivity. If it does not show conductivity, then you should use star washers, braid, ground straps, etc, to ensure your bike frame is attached for an (admittedly poor) RF ground.

From: n1evh@verizon.net
Topic: 2103 Message: 2109

What are you using for a 6m antenna???

Well... I was surprised today.

I checked my bike with a continuity meter and the screws that attaches the antenna mount to the bike frame and the handlebars show a short. I then checked between the screws that holds the bike rack to the bike frame and the aluminum mount... and that too showed a short. So I guess even with paint on the bike rack and bike frame... there is enough metal on metal contact to make a connection between the antenna mount and the bike frame.

I connected about 13 feet of RG-8X on the antenna and put that to my Diamond SWR meter.. and then connected my VX-7R to it. All 3 bands (6m, 2m, and 70cm) showed under a 2:1 SWR (I can probably get it lower if I play around with the antenna some).

There isn't all that much 6m activity in my area... so if I can't get 6m to work well... I'm not going to worry about. Even tho the antenna is vertical, I guess I could rig up my FT-817 and try that on SSB on 6m.

There are many points on the bike that you can connect a ground strap to.... seat post binder comes to mind first....

We use RG-174 on my wife's bike with the Icom T90A and a triband (6/2/70) antenna and we have used the 6M to communicate on simplex between us through the mountains without much difficulty.

>>> n1evh<n1evh@...> 9/4/2009 8:19 AM >>>

I'm in the process of setting up a antenna on my bike for VHF/UHF. I have a couple of questions.

First... I have a Trek 3700 mountain bike. I've added a Topeak Explorer Tubular Rack (w/o springs) on it. I then cut and put a flat piece of alumunim on the rack. At the end of the piece of aluminum... I put an aluminum "L" bracket that originally had a SO-239 to 3/8-24 adaptor on it and i drilled it out and out a 2" SO-2399 bulkhead barrel on it. I

have a Diamond CR627B (6m/2m/70cm tri-band) mobile antenna that I was going to put on it.

Now there was some recent talk of running 6m on a bike... and people talking about how big a 6m j-pole would be. Now since this Diamond antenna is a 1/4-wave on 6m... has anyone tried bonding the antenna mount to the bike (since there is paint between the antenna mount and bike rack and then between the bike rack and bike) to see if a bike would provide an ample groundplane for 6m???

Also... what would you use for coax and... is coax length critcal??? At first I was thinking about using like 10 to 12 feet of RG-58A (it has a stranded center conductor compared to the solid center conductor in regular RG-58)... but then started to think about using 10 to 12 feet of like RG-174 or LMR-100 with either BNCs or SMAs on both sides.

This setup would mostly be used on 2m.

Thanks,

Mike - N1EVH

Well... you don't really need a ground plane on 2m. Most of the dual-band mobile antennas made these days (whether by Diamond, Comet, Larson, etc) are "ground independent"... they don't need a ground plane at all.

My Diamond CR627B is a 1/4-wave on 6m, three 1/4-wave on 2m, and three 5/8-wave on 70cm. It says it doesn't need a ground plane for 2m or 70cm, only for 6m.

I checked my bike with a continuity meter... and I was surprised to see that when I put one lead on the antenna mount and the other lead on various parts of the bike (screws that attach the bike rack to the frame... screws that attach the water bottle cage to the frame... handlbar post)... it beeped. So I
guess there is metal-to-metal contact between my homemade antenna mount and the rest of the bike.

When I connected myVX-7R to the antenna on my bike with some RG-8X and my Diamond SX-600 SWR meter... it showed under 2:1 on all bands. I may be able to get it lower if I play around with the antenna.

Well... I don't know how much coax I need... but 10 to 12 feet was just a guess.
I have a website that is a "coax calculator"... it shows how much loss there is
at a frequency for various types of coax. RG-58 has between .468dB and .67dB of loss (depending on which if the various types of RG-58 you use) on 2m at 10 feet, LMR-195/200 has .392dB of loss on 2m at 10 feet, RG-174 has 1.06dB of loss on 2m at 10 feet, and LMR-100 has .879dB. 6m is a bit better for each
coax and 70cm is a bit worse.

Without a flat surface or radials for a ground plane for 2m and 440 you can't know where you signal is going. It could be transmitting a good portion of it straight up.

Mike:

I'm becoming a fan of flagpole-mounted jpoles and coaxial dipoles (haven't tried an end-fed one with the necessary matching network yet). I think they're lighter than mounting a vehicular antenna after you add in rack and hardware. However, you've already added the rack and plate and you want 6M anyway, so...

You should post photos of your setup if you haven't already.

I'd use whatever you have on-hand for feedline, route it along the bike to the radio and cut to length (leave a little extra for strain relief or repositioning the gear). I'm using RG58 and 174 (depending on which 2M antenna) and haven't noticed a huge fall-off in performance with the thinner feedline, at least from limited testing on 2M. I don't think there is that much loss to worry about at runs of a few feet, and psychologically prefer the lower weight of 174.

One thing I do not like on a bike are SMA connectors. I've had to tape, reinforce, provide lots of strain relief, and just don't trust them with all the vibration there is on a bike, even on pavement. If your rig has an SMA connector (like my VX5), get a SMA-to-BNC (or SO239) pigtail and connect to that. Use some electrical tape to hold the SMA connector in place.

That's exactly what a jpole is... It's a half wave dipole end fed
with a matching section.

I'm a big fan of them. Specially one made completely from RG-58.
There's a web page out here somewhere documenting it but I keep losing
it.

Not sure about the sentiment on SMA connectors... Barb has ridden the 175 miles of the Tour de Park City twice now, LOTOJA last year and a whole bunch of other 100 mile rides with the ICom connected to the antenna with SMA connectors and that's one thing that has never fallen off or worked loose. I do make sure the connectors are really snugged down (finger tight) but I'd trust the SMA more than I would a BNC. Personal opinion.

I should have explained better what I meant. I was thinking of end fed 1/2 wave antenna designs for HF where instead of the transmission line-based matching section of a j-pole, the antenna uses a tuned circuit from discrete components for the high-z to low-z matching. Although I have not seen any plans for one at VHF and have not taken the time yet to work out the component values for the matching section myself. At VHF, a transmission line match may simply be better than lumped components. Length of the matching section is not a problem at VHF, and twin lead is certainly cheap enough.

> I'm a big fan of them. Specially one made completely from RG-58.
> There's a web page out here somewhere documenting it but I keep losing
> it.

You should post it here if you do find it. The closest thing I've found is a coaxial vertical dipole, made by either folding back the coax braid for about 19" or sliding the coax through a separate braid; the center connector forms the upper half of the dipole and you weather-seal it. Hangs like a jpole but eliminates the length of the matching section. I have one I found at a hamfest eons ago, my patience and dexterity (or lack of) has prevented me from replicating the design myself. so far.

I also located a tri band (6/2/70cm) Diamond mobile whip I forgot I had. I can mount it on my commuter bike off the rear rack; I may try some comparisons of how it performs vs. the flagpole jpole.

Well... I'm not making my selection of RG-58 or RG-174 on "weight"... I'm making it on the flexibility of the coax up at the radio end (with constant turning of the handlebars).

I know its not much movement... but I've never liked the idea of a single, solid, small gauge diameter center conductor in a coax when there would be coax movement. At least RG-174 has a stranded center conductor. LMR-100 is the same size as RG-174... but I believe that too had a solid center conductor. I would probably be happy with some RG-58A which has a stranded center conductor.

6m isn't a "must" for me... I was curious about 6m since I have a tri-band mobile antenna that I can use on my mountain bike. With the Diamond CR627B being a 1/4-wave on 6m... I didn't know if the bike's frame would offer up enough of a counterpoise/groundplane for 6m or not. This is why I figured I would ask if anyone has done/tried that already. If I only had a 2m/70cm dual-band mobile antenna... then I wouldn't be wondering about getting 6m to work on my bike (even tho I have a VX-7R and a VX-5R before that).

The rack on my bike... has been on there. I didn't put it on there with the thoughts of using it to mount a mobile antenna on it. I just never really thought
about attaching some sort of mount to it for VHF/UHF work until recently. In the past... I've usually just used an HT with a "better than stock" rubber
duck antenna.

Once I get my mobile antenna setup and working on my bike... them I may see about trying to mount my FT-817 on my bike. Could put it in the trunk bag on the rack... but then I would need to rig up a speaker and I wouldn't be able to change frequencies easily (and I would lose out on my ability to receive local police and fire... due to receive limitations of the FT-817).

Not sure about the sentiment on SMA connectors... Barb has ridden the 175 miles of the Tour de Park City twice now, LOTOJA last year and a whole bunch of other 100 mile rides with the ICom connected to the antenna with SMA

connectors and that's one thing that has never fallen off or worked loose. I do make sure the connectors are really snugged down (finger tight) but I'd trust the SMA more than I would a BNC. Personal opinion.

>>> BrassRat77<ks1g04@...> 9/4/2009 7:21 PM >>>
Mike:

I'm becoming a fan of flagpole-mounted jpoles and coaxial dipoles (haven't tried an end-fed one with the necessary matching network yet). I think they re lighter than mounting a vehicular antenna after you add in rack and hardware. However, you've already added the rack and plate and you want 6M anyway, so...

You should post photos of your setup if you haven't already.

I'd use whatever you have on-hand for feedline, route it along the bike to the radio and cut to length (leave a little extra for strain relief or repositioning the gear). I'm using RG58 and 174 (depending on which 2M antenna) and haven't noticed a huge fall-off in performance with the thinner feedline, at least from limited testing on 2M. I don't think there is that much loss to worry about at runs of a few feet, and psychologically prefer the lower weight of 174.

One thing I do not like on a bike are SMA connectors. I've had to tape, reinforce, provide lots of strain relief, and just don't trust them with all the vibration there is on a bike, even on pavement. If your rig has an SMA connector (like my VX5), get a SMA-to-BNC (or SO239) pigtail and connect to that. Use some electrical tape to hold the SMA connector in place.

Don't take my experience too seriously, I've only been riding with radios steadily for the last 4 years or so commuting to and from work. I've put a few thousand miles on an Icom W-2A with its BNC connector and many more miles on my Kenwood TH-D7 with its SMA connector. SMA connectors ARE more easily broken than BNC, but I've never seen either break or separate in bicycle mobile use.... Mine break for some reason when I have the HT in my shirt pocket and bend over for the slightest angle... the HT invariably crashes to the floor or ground, and unlike a cat that lands on its feet, HT's seem to always want to land head first at an angle putting maximum stress on the antenna connector. My Alinco HT always breaks the ANTENNA right at the SMA connector, the BNC connectorized radios usually don't completely break.... they develop a sad looking case of "lop-ear" antenna where the inner metal frame holding the BNC bends and occasionally breaks the soldered connection inside. The D7A has lost one SMA connector in similar fashion, but again, this is in "pedestrian service", not while mounted on the bike.
I have never had problems with RG-58 coax damaging connectors or suffering damage in thousands of miles of bicycle mobile operation. Of course, I don't mount the radios directly to solid mounts, either. I have used "springy" aluminum mounts that took much of the shock out of the radio during road bouncing and currently use a homemade "sandwich" mount using foam shock absorber packaging to absorb shock. But the "vibrating coax problem" I see some worrying about is something I have not seen. My homebrew fiberglass bike flag J-poles require repair at the feedpoint of the antenna every few months, but I just have never had the BNC connector on the radio end of the coax fail in any manner.

Hi all,
Speaking for myself, I'll never buy another radio with an SMA antenna connector again. The inherent design weakness just doesn't seem suitable for that purpose. Besides, I use BNC cables for EVERYTHING. If a radio or tuner or any other device comes with a UHF connector instead (another questionable connector due to the electrical characteristics), I immediately attach a BNC to UHF adaptor so that all components are cable compatible. The addition of yet another connector just complicates things even further. Just my $.02.

Here, here!! I agree I have used a th7 since they came out on my bikes BNC, RG-58, to NMO mount on rack. Never a problem. Go to http://groups.yahoo.com/group/BMHA/files/N0HZ/ to see pictures of my old bike and the installation I have used since before 2003. I easily put on 3000 miles per year/summer and remember this is MN. I rode around Lake Superior last year with this setup. You can read about it and see pictures at www.jarosh.org. I have had more issues with my Car installations.

You're really going to be limiting your choices for radios, then, especially HT's. SMA's seem to be taking over the world... is there a current handheld that doesn't use SMA? Many don't seem to like BNC, but I like them because they are a good connector RF wise, and most especially I like the quick-connect and quick-disconnect feature.

I agree with Jim that SMA's on HTs seem inevitable, at least on the smaller rigs. And I like the positive lock feature of BNC, something SMA, UHF, and even N lack. Not that any connector on an HT is going to last in a mobile environment without strain relief (my old FT209 was my mobile rig for a few years and also had connector issues).

In the meantime, I'll use a wrap or 2 of electrical tape to keep SMA connectors on but removable when I need to go walkabout off the bike.

And speaking of UHF, I've been testing a SO239-base whip on the bike and am less than impressed by it's habit of loosening in a just a few miles. (Also unimpressed by the fewer position packets getting through but that's a different thread.) It always stayed put on the car. Sounds like a job for - more tape! (So if duct tape is like The Force, is electrical tape like a padwan?)

Hello you all,

I am really getting into the bike thing, and would like to find a good recumbent bike . I have seen the price on line..WOW not nice. So I am asking for advice and maybe a little luck will find me one.

I would like to run my FT-817 on it, etc, maybe my SG-2020, NON-ASDSP model.

So what can you tell me?

2130. Re: Help..I am looking for a bike.. Recumbent

Yahoo group: BMHA
Date: 2009-10-08 15:12:07 UTC
From: AOX
Topic: 2126 Message: 2130

Recumbents remain very pricey whether online or in your local bike supermarket. Used ones, however, can be quite reasonable by comparison.
Watch www.craigslist.org and Ebay regularly if you want to catch one.
I belong to a local cycling club mailing list and spotted a guy who was offering 2 recumbents for sale. The wife and I went over to look at them. One was shorter and one was a long unit, sufficient for me to fit at 6 feet 2 inches. The wifey, a non cyclist, somehow got enamored with the smaller one and took it "just for a spin". I wound up having to buy both of them... for less than the normal recumbent price. 400 for mine and 300 for the wife's. I ride mine daily across town to work and the wife rides hers a couple times a month.
My perceived advantages of a bent:
-Ride faster with same effort

-Slightly less tired for a given travel distance

-Occasionally outrun or pass other cyclists (almost NEVER happened on my DF stock bike) - a nice feature at age 62

-Headwinds still slow me down but not discouragingly. It doesn't feel like I'm pushing a block wall on the 'bent (lying back presents a lower profile and thus pushes and intercepts less wind).

-Back and butt no longer suffer excruciating pain during and after rides

-Hands, shoulders, and wrists no longer ache while riding

-Neck no longer hurts from riding bent forward with head cocked back so I can see out front

Disadvanges of my bent:

-Takes a while to learn how to ride with the different center of gravity, braking behavior, etc.

-CANNOT stand up on the pedals to start or accelerate

-MUST gear down for every slowdown or stop, see previous

-As per above, jackrabbit starts are nigh impossible with my bent, so bigger gaps are necessary for me to cross a traffic filled street.

Most of us cyclists are used to being able to stand up on the pedals and leap forward in quick bursts to avoid obstacles or catch openings in traffic.... can't do that on a bent.

My bent is about 1/3 longer than my DF bikes, but it still mounts and rides OK on my homemade car bike rack.

I saw a trash truck miss a 'bent rider by mere inches a few months ago. He was so low the stupid truck driver never saw him.

For self respecting bike-hams, that shouldn't be a problem. My fiberglass bike flag (converted into a 2 meter J Pole) tops out at about 8 feet in the air. They cost about $1.50 at Wal Mart so there is little excuse for not using one on all bikes whether wired for RF or not.

Hi all

Yep, check the usual ebay/craigslist/etc. One other option to consider are the recumbent trikes which do provide some extra stability. My trike is heavy but it is a good cruiser. Not planning any land-speed records but its a rush going down hill. This one is the under seat steering but there are above seat versions as well.

Oyez, trikes are REALLY cool and I have not yet found an affordable one. I advise NEVER buy a bike or trike unless you have test ridden at least a few miles to see if it "fits" you at all.
I have test ridden a couple used trikes that weren't bad, EXCEPT they only had 8 or so gears. That can get old in a hurry when you want to actually USE the trike to travel around town a bit and have to:
-Climb a hill
-Go DOWN a hill
-Etc.

Watch for trikes that have 24 or more gears. You won't need ALL of them, but you'll use the higher and lower gears and lots of in-betweens cranking around hill and dale. Adding battery and radios will make you glad you have extra gears..
There are several "starter" trikes selling for less than a kilobuck that have only a few gears and you will quickly wind up using craigslist to trade it off for a higher performance unit.

From: CSM(r) Gary Huber - AB9M
Topic: 2133 Message: 2133

See http://www.terratrike.com/cruiser.php for a 24 speed recumbent trike for $1500.

Three rings up front by eight in the rear give plenty of range from 16 inches to 116 inches per crank revolution.

I've owned one for a couple of years and have it set up for APRS. Great starter ride and hard to beat for the price.

Bents are the way to go. No more back pain, wrist pain, butt pain, neck pain, etc. After a 50 mile ride I'm tired but I don't hurt. That's the way it is supposed to be. Some of the less expensive pig iron bents are really heavy lunkers and not good on hills. If you spend some money, sometimes serious money, you will definitely ride more and you will climb hills easier. However, even lunkers are much nicer to ride than wedgies (sorry) as long as the hills are reasonable.

My Bacchetta Aro gets heavy with all the radio stuff hung on it but fortunately I carry the gear only for scheduled events.

Recumbents remain very pricey whether online or in your local bike supermarket. Used ones, however, can be quite reasonable by comparison.

Watch www.craigslist. org and Ebay regularly if you want to catch one.

I belong to a local cycling club mailing list and spotted a guy who was offering 2 recumbents for sale. The wife and I went over to look at them. One was shorter and one was a long unit, sufficient for me to fit at 6 feet 2 inches. The wifey, a non cyclist, somehow got enamored with the smaller one and took it "just for a spin". I wound up having to buy both of them.... for less than the normal recumbent price. 400 for mine and 300 for the wife's. I ride mine daily across town to work and the wife rides hers a couple times a

month.

My perceived advantages of a bent:

-Ride faster with same effort

-Slightly less tired for a given travel distance

-Occasionally outrun or pass other cyclists (almost NEVER happened on my DF stock bike) - a nice feature at age 62

-Headwinds still slow me down but not discouragingly. It doesn't feel like I'm pushing a block wall on the 'bent (lying back presents a lower profile and thus pushes and intercepts less wind).

-Back and butt no longer suffer excruciating pain during and after rides

-Hands, shoulders, and wrists no longer ache while riding

-Neck no longer hurts from riding bent forward with head cocked back so I can see out front

Disadvanges of my bent:

-Takes a while to learn how to ride with the different center of gravity, braking behavior, etc.

-CANNOT stand up on the pedals to start or accelerate

-MUST gear down for every slowdown or stop, see previous

-As per above, jackrabbit starts are nigh impossible with my bent, so bigger gaps are necessary for me to cross a traffic filled street.

Most of us cyclists are used to being able to stand up on the pedals and leap forward in quick bursts to avoid obstacles or catch openings in traffic.... can't do that on a bent.

My bent is about 1/3 longer than my DF bikes, but it still mounts and rides OK on my homemade car bike rack.

I saw a trash truck miss a 'bent rider by mere inches a few months ago. He was so low the stupid truck driver never saw him.

For self respecting bike-hams, that shouldn't be a problem. My fiberglass bike flag (converted into a 2 meter J Pole) tops out at about 8 feet in the air. They cost about $1.50 at Wal Mart so there is little excuse for not using one on all bikes whether wired for RF or not.

2136. FCC and ride support

Yahoo group: BMHA
Date: 2009-10-08 20:48:57 UTC
From: Mickey Applebaum
Topic: 2136 Message: 2136

Hello all...

I am wondering how those of you out there are planning on dealing with the issues raised by the FCC in regards to the use of Amateur Radio for the support of such public service events as bicycle rides (parades, marathons, triathalons etc) where such use can be construed as a violation of 97.113.

Out here in Utah we've even got one of the commercial radio providers threatening to sue to get a cease and desist order to prevent HAM's from being part of such events (as well as threatening to provide call signs and recordings to the FCC for prosecution) if we continue to do so.

Any thoughts?

Mickey

Al: Where are you in MD? Mt Airy Bikes/College Park Bikes (2 locations) is sells new and used recumbents. http://www.bike123.com/ I'd check out their web site and call them. Closer to me (but a lot farther for you), Bikes@Vienna (Vienna VA) sells new and used 'bents and usually has a variety available for rent and test riding on the W&OD bike trail.

Subject: [BMHA] FCC and ride support

Hello all...

I am wondering how those of you out there are planning on dealing with the issues raised by the FCC in regards to the use of Amateur Radio for the support of such public service events as bicycle rides (parades, marathons, triathalons etc) where such use can be construed as a violation of 97.113.

Out here in Utah we've even got one of the commercial radio providers threatening to sue to get a cease and desist order to prevent HAM's from being part of such events (as well as threatening to provide call signs and recordings to the FCC for prosecution) if we continue to do so.

Any thoughts?

Mickey

Actually, in 97.113 it does state that Amateur Radio should not be used when another radio service (i.e. Land, Marine, Commercial) is available and able to provide the support needed.

For the Diabetes Association's Tour de Cure (which I help co-ordinate the SAG support) this would mean that we have to contact a commercial radio service provider, have them tell us whether they can cover the entire route, and then get them in the field for a proof of service before we can say whether the HAM's would be able to provide support for the ride (assuming the commercial provider can not provide coverage throughout the route). To me, this puts an undue burden on the event organizers to prove that commercial radio services can not cover the event before contacting HAM's to help out.

After reading that part. That gentlemen needs to find another hobby. As I read it, I see he has no case what so ever.

But in saying that, have a talk with ARRL.

I believe the issue dealt with Amateurs who are employees of the organization sponsoring the event. Most of the time the Hans that support a ride are not employees of the sponsoring organization so there doesn't appear to be a conflict.

And it's from that article that these lines are from...

It is a narrow path between (1) utilizing beneficial opportunities for public service communications and showcasing the continued relevance and importance of Amateur Radio communications to the public; and (2) allowing organizations to exploit Amateur Radio as a cheap and flexible alternative to the Land Mobile Radio Service, General Mobile Radio Service, or Commercial Mobile Radio Service facilities.

Amateur Radio should not be used as a substitute for Part 90 Land Mobile communications or other reasonably available alternate communications systems, including unlicensed services.

this is what brings HAM radio use into question for event management...

This kind of issue has been brought before the FCC before, and been thrown out. As long as it's not for profit or personal gain, there's no problem. Now, if that individual wants to waste their time and money to take it before them, he can go right ahead. But there's already case law to allow it. The comment about some of the people being employees and Amateurs may have some validity. Solution: No one who is an employee of the organizer may provide amateur radio service while in the employ (on the clock) of the organizer.

Kind of reminds me of somebody who complained to Riley Hollingsworth about me in the mid 90's. Mr. Hollingsworth basically told him to go suck an egg!

Incidentally, "should" has a vastly different meaning than "shall". "Should" is akin to saying, "It doesn't hurt to check", where "shall" is "you must check".

The key here seems to be "reasonably available". If a Part 90 isn't reasoably avilable, ie, able to be reasonably afforded by the event budget, then there shouldn't be a problem.

Hams would really just be enhancing the safety and practising their skills they might need in emergencies.

Seems to me that some have gotten confused with this ruling as I have heard that if your on the job ham radio is a no no, but off the job than ham radio is a go! That is how I see it here.

Say my boss wants comm for relief efforts while I am on the clock, I don't even touch the radio - period, now, if I were to volunteer the effort as a ham and not an employee, than, I can justify the use of ham radio to for that matter - otherwise, kiss my grits to ground floor!

Unfortunately, that's not how the law is written... this paragraph,

My e-mail from the FCC
In June 2009, I received an e-mail from Laura Smith, an FCC attorney charged with Amateur Radio enforcement. ??

She was responding to a May 2009, blog post on N5FDL.com in which I described a hypothetical event in which hams who are employees of a hospital participated in an on-air Amateur Radio emergency communications exercise, but as volunteers for a county government-sponsored group and on their own time. This appeared to me to avoid the "business communication" prohibition. ??

I was wrong.

"Simply put, a hospital drill that includes any amateur employees of the hospital is a violation of Section 97.113(a) (3). It does not matter if the amateur is "off duty" or on their "lunch hour"; it does not matter if their job description does not include the so-called operation of the amateur radio; it does not matter if they are not getting paid specifically for the drill; it does not matter if they sign a statement indicating that they are doing this strictly as a volunteer. I trust I am making this clear, it does not matter what machinations you come up with, there is no loop hole to the rule. If they are a hospital employee, they may not use the radio on behalf of their employer - period."

is from a QRZ blog at http://forums.qrz.com/showthread.php?t=218059

Which still does not have any bearing on the requirement to use Part 90 communications for public service events, such as bike rides and parades and such, which is the part I am wondering how folks are going to address for the upcoming riding season... this is stated in the FCC regulations as such...

Amateur Radio should not be used as a substitute for Part 90 Land Mobile communications or other reasonably available alternate communications systems, including unlicensed services.

Some could make the point that cell phones are one of those other reasonably available alternative communications systems...

You're leaving out an important point, Mickey. The actual text of the regulation says this (from http://www.arrl.org/FandES/field/regulations/news/part97/b.html#113): "(a) No amateur station shall transmit: ... (5) Communications, ON A REGULAR BASIS, which could reasonably be furnished alternatively through other radio services." [emphasis added]

That statement about a regular basis makes all the difference, in my opinion. It seems unreasonable to consider an annual parade or bike ride as something that is occurring on a regular basis for the purposes of the regulations. Now if the organization were sponsoring a bike ride every week, same time, same place, then one could say THAT would be problematic for using amateur radio.

In the ARRL Appropriate Use document that was mentioned here earlier, it says "A good rule of thumb when evaluating a particular request for communications support is, ?Who benefits?? If public safety is the principal beneficiary, then ?97.1 is being fulfilled. If the entity itself and not the general public is the principal beneficiary, then they should be encouraged to use radio services other than Amateur Radio." It seems to me that public safety, and the public in general, is the clear and principal beneficiary for these events.

Just my 2 cents...

> is the clear and principal beneficiary for these events.

The rules are certainly open to interpretation, and few of us are
lawyers, so I think we need to make best effort to comply with the
spirit of the regulations.

I've seen for-profit organizations like athletic events, which use
hams to provide services that really could be done by cell phone or
other means.
This does make me nervous. The local hams seem to be ok with ignoring
the fact that these are for-profit events and by providing free
support we are increasing the profits. They want to get ham radio out
there at every opportunity, and I'm all behind that, but the main
thing that separates us from the CBers is that we follow the rules.

If the event is for a charity, non-profit, or disaster preparedness,
then I don't see any conflict. Even if there WERE other services that
could provide comms, the disaster drills are done assuming that those
entities are offline or choked with other traffic.

Bottom line, we are each responsible for complying with the regs, and
we should do what we think is right, because we will individually bear
the consequences if we are wrong.

And it wouldn't hurt for there to be a document showing cases that
illustrate how the FCC is interpreting the regs!

I don't know much about 'bents, but will probably wind up with one since I have developed a bad neck. So thanks for the Utah link. I'd like a tandem one, though, for my YL/stoker. That TerraTrike Tandem is lovely, but I'd like to get something cheaper(!).

BTW in the Pac. NW, Cambie cycles in Vancouver BC, Fairfield in Victoria BC and Coventry in Portland, OR specialize in 'bents. There must be a store in Seattle, but I don't know... But I'd certainly recommend riding one of these before you buy one - i.e. your LBS rather than online purchasing.

Subject: [BMHA] Re: Help..I am looking for a bike.. Recumbent

Recumbents remain very pricey whether online or in your local bike supermarket. Used ones, however, can be quite reasonable by comparison. Watch www.craigslist.org and Ebay regularly if you want to catch one.
I belong to a local cycling club mailing list and spotted a guy who was offering 2 recumbents for sale. The wife and I went over to look at them. One was shorter and one was a long unit, sufficient for me to fit at 6 feet 2 inches. The wifey, a non cyclist, somehow got enamored with the smaller one and took it "just for a spin". I wound up having to buy both of them... for less than the normal recumbent price. 400 for mine and 300 for the wife's. I ride mine daily across town to work and the wife rides hers a couple times a month.
My perceived advantages of a bent:
-Ride faster with same effort

-Slightly less tired for a given travel distance

-Occasionally outrun or pass other cyclists (almost NEVER happened on my DF stock bike) - a nice feature at age 62

-Headwinds still slow me down but not discouragingly. It doesn't feel like I'm pushing a block wall on the 'bent (lying back presents a lower profile and thus pushes and intercepts less wind).

-Back and butt no longer suffer excruciating pain during and after rides

-Hands, shoulders, and wrists no longer ache while riding

-Neck no longer hurts from riding bent forward with head cocked back so I can see out front

Disadvanges of my bent:

-Takes a while to learn how to ride with the different center of gravity, braking behavior, etc.

-CANNOT stand up on the pedals to start or accelerate

-MUST gear down for every slowdown or stop, see previous

-As per above, jackrabbit starts are nigh impossible with my bent, so bigger gaps are necessary for me to cross a traffic filled street.

Most of us cyclists are used to being able to stand up on the pedals and leap forward in quick bursts to avoid obstacles or catch openings in traffic.... can't do that on a bent.

My bent is about 1/3 longer than my DF bikes, but it still mounts and rides OK on my homemade car bike rack.

I saw a trash truck miss a 'bent rider by mere inches a few months ago. He was so low the stupid truck driver never saw him.
For self respecting bike-hams, that shouldn't be a problem. My fiberglass bike flag (converted into a 2 meter J Pole) tops out at about 8 feet in the air. They cost about $1.50 at Wal Mart so there is little excuse for not using one on all bikes whether wired for RF or not.

Hi Al,

I mount my radio on the handle bars of my bike, you can see more detail on this link:
www.qrz.com/db/g4akc
The radio can be removed quickly and is waterproofed by a cover which can be seen in the pictures.
Let me know if you want some more detail.

I find carrying my bike radio(s) in the carry-packs, whether leather or cloth, provides very good isolation from the normal jarring of the bicycle while in motion. Backpack, pannier, etc, also provide shock isolation to some degree.
If mounting the control head on the handlebars is desired, I suggest making or procuring a shock absorbing mount. For my TH-D7 handlebar mount I use a Ram lexan TH-D7 bracket mounted to an aluminum plate sandwiched to a copper clad PC board plate which has the actual clamps etc. to attach to the handlebars. The "vibration sandwich filling" I use is 1" gray cellular foam padding, robbed from various shipping packages wherein test equipment was unpacked when received.
I always keep several sheets of this stuff stashed in the storage places at the house for replacement purposes, but surprisingly the life span seems to be good. The latest foam sheet has lasted over 2 years (5-days-a-week bicycle commuting 10 months out of the year) without deteriorating to the replacement point.

I guess it depends on the riding you plan on doing.
If you are looking for dirt / rough roads, I would consider something that will have some shock protection. WA5's list below sounds like something that would work well.

However, if you are looking for casual street riding, with the occasional bump or pothole.. You can get away with just a padded case.

On my Rans Veloctiy squared (recumbent) during my 2003-4 east coast bicycle tour from Canada to Key west Florida, 99% was street riding. No problems with the padded case, the radio survived fine and still get used today.

Now.. the real question... how / what are you going to use for a Mic?
Wind noise, especially over 18 MPH, really comes into play.

2162. Miracle Mixed-mode dipole

Yahoo group: BMHA
Date: 2009-11-27 15:27:47 UTC
From: Ron Baran
Topic: 2162 Message: 2162

Greetings all,

Went to the Miracle website http://miracleantenna.com/mmd.htm and it was a bit sparse on information. I was contemplating using this as a fixed antenna in a long wire configuration.

Anybody have any info on this puppy? I seems to recall some negative issues with this outfit?

Sure would be tough on a bike :-)

Can't believe the prices of these antennas,
bet it will not work any better than the
Five Dollar / Five Minute antenna
<http://www.wa0itp.com/antennas.html>

and I know it works very well.

Nice Walter! Quick update - not for the bike :-(

Seemed like a goofy configuration and I couldn't understand exactly what they were doing - not that I'm that bright about antenna theory in the first place.

I wonder how many of the group routinely play bike mobile on the HF frequencies? It seems that, as Cycle 24 starts to ramp up, HF bike mobile ought to become a little more feasible.

I think that you're right about the long wire antenna. With the lay of the land at this QTH it seems like the only reasonable way to get on 40 and 80.

2166. Dayton Hamvention BMHA Forum 2010

Yahoo group: BMHA
Date: 2009-12-04 18:39:46 UTC
From: nf0n
Topic: 2166 Message: 2166

We have been approved for a BMHA Forum in 2010. Our time will be on Sunday morning for 1 1/2 hours. More detail to follow.

I am looking for speakers and those who wish to demo their setup or project. If the Hamvention stipend is as in prior years, speakers will receive a Hamvention pass and a good parking spot.

Happy Holidays to all and get those miles in on the bike, maybe inside!

2173. G4AKC Bicycle and pedestrian mobile on 20M

Yahoo group: BMHA
Date: 2009-12-28 10:39:32 UTC
From: David
Topic: 2173 Message: 2173

Hello everyone and "Happy Holidays"

I will be QRV on 14.200 plus or minus the QRM running high power from either bicycle or pedestrian mobile from around 1400UTC to 1600UTC ...

Weather here is cold around -1 deg but I will have my thermals on and a heated coat which I got for Christmas! .... so should be fine.

Hope to hear from other bike or pedestrian mobile stations.

I will get someone to post on the web cluster to identify my operational frequency.

73's ...

As far as that goes... My wife and son are Tech's and can't use the HF bands so we just do 2 Meter and 440 MHz when on the bikes.. Sometimes, though, there isn't even reason to do that.. for example, last Friday was the New Years Revolution century but there were only 17 riders so we decided to skip putting the HT's on the bikes and all just stuck close together.

Many of us (for convenience, antenna size or preference) stick to VHF/UHF when bicycle mobile, and don't do bike-mobile HF.

Subject: RE: [BMHA] HF Bicycle and Pedestrian Activity

From my stand-point up here in Minnesota where it is currently -15F/-26C,
it
is a little hard to convince myself to do pedestrian mobile let alone take
my bike out for a ride. I kind of shut down during the winter unless I go
ice fishing in my friend's heated fish house.

Earl, N0HZ

Subject: [BMHA] HF Bicycle and Pedestrian Activity

Just a note to say considering there are nearly 700 members of the BMHA
there is very little real HF bike or pedestrian mobile radio activity.

I don't know where all the members are, it seems the only active bike
mobiler is Budd from California W3FF.

Hope to see more activity during 2010?

20M band conditions are excellent, I made over 100 contacts from my
pedestrian mobile yesterday mainly into USA, from East to West coast
between
1500-1700 UTC.

How about if it is a federal waterway with Coast Guard service, such as the Salt River system in Arizona, lakes in Texas, the Great Lakes. Would that make it "Maritime"?

Hi Guys,

No offence meant, I was just hoping that there would be a bit more activity.
The weather here is the same it was -7 deg C yesterday when I was out, but I was lucky enough to be bought some powered thermal underwear by my XYL so I was toasty warm... until the batteries ran out!

2187. Custom Antenna Mount

Yahoo group: BMHA
Date: 2010-01-05 03:44:38 UTC
From: william.crews@att.net
Topic: 2187 Message: 2187

I found this great looking antenna mount on a ham's blog site who also enjoys cycling. He milled it himself. I don't have the skills or the equipment to undertake the project so I am looking for a hobby machinist willing to help. Any suggestions? The photo of it is in the group's photo folder under Cutom Antenna Mount.

If the stock weren't so thick, I'd suggest FrontPanel Express.

I think Emachineshop might work though.

Turns out that's mine...

I carved it out for our daughter and wrote about building it in my Digital Machinist column for Fall 2009. Now that the column has been out for a while, I suppose I can put up a few posts about the thing.

Bill asked me if I could build one for him. I suggested a local machinist would be a better choice, as the thing must be made to suit the exact details of the bike, which is difficult to do at a distance.

The biggest hassle was machining the trenches that clamp the seat rail; if I had the right size ball-end mill, that'd be trivial.

I'm unhappy with the wiring to the SO-239 panel-mount socket. Some mobile mount coax cables with right-angle, long-snout sockets have been sitting on the workbench; I'm hoping some Round Tuits arrive before the spring riding season opens.

I wrote up an earlier and much klutzier mount on my blog:

http://softsolder.wordpress.com/2009/07/11/recumbent-bicycle-amateur-radio-antenna-mount/

Shorter link: http://wp.me/poZKh-vU

The reason for the mounts in the first place: vibration destroyed the spendy commercial mounts we'd been using:

http://softsolder.wordpress.com/2009/07/10/commercial-mobile-antenna-mounts-on-a-recumbent-failures-thereof/

Shorter link: http://wp.me/poZKh-w4

Quite some years ago, on my Linear 'bent, some [obscene gerund] [censored noun] clubbed me in the back of the head with a half-full soda bottle; I didn't crash, but it was a near thing. The antennas are on the left side of the seat rail, rather too close to our heads, as a bit of armor against that sort of thing...

Ride on!

A suggestion for the SO-239 panel mount:
Instead use a "UG-363/U" UHF Female to UHF Female Bulkhead (2") connector.
An elbow can be used.
It can be converted to BNC.

I have a replacement "UHF nut" that provides a NMO connection (for a VHF/UHF antenna) although a commercial bracket (heavy duty stainless) I use has the NMO connector already.

Nice machine job. I made a "similar" bracket from black delrin to hold my GPS.

Turns out you answered the main question I had which is what kind of bike
it's on. I knew it was a recumbent, (I ride a SWB Jetstream) and was curious
if you're essentially using the entire frame as the ground for the antenna.
I haven't read the link you posted yet, but am heading there now.

> Instead use a "UG-363/U" UHF Female to UHF Female
> Bulkhead (2") connector.

That's basically what I've got on the bench: a 1-inch UHF-style threaded snout with a right-angle coax cable attachment on the bottom.

I think they're stainless steel, which should be less anodic against the aluminum than whatever the panel-mount connector was plated with. Poor thing has the ick...

> if you're essentially using the entire frame as the ground
> for the antenna.

It's mounted on a Tour Easy, so in principle there's a looooong bunch of steel down there, but I suspect the frame doesn't work nearly all that well. The seat connects to the bike frame at only four points: two under-seat bolts and two dropout screws, none of which were designed with RF (or even DC) in mind.

But the seat's a hulking mass of steel & aluminum tubing, so it's about as good a counterpoise as I'm going to get. I put that braid on there to bond the antenna base to the seat, sprinkled holy water around the bike, and it's all good.

Mostly we use the radios as intercoms while riding, so anything better than a disconnected coax cable would be OK. They work fine on simplex for public-service events and hit the local repeater (admittedly, high atop Mt Beacon) from pretty nearly everywhere in the area.

2194. CW Blog

Yahoo group: BMHA
Date: 2010-01-21 18:50:53 UTC
From: n7net
Topic: 2194 Message: 2194

Twenty years ago I copied a fellow who transmitted sea stories on 40 meters. It was a great help for me and I missed him after the
FCC shut him down.

Without a doubt there are many cyclist wishing they had a better handle on CW, enabling them to keep on pedaling and copying in their head. In an attempt to emulate that old seaman I've initiated a weekly CW Blog.

For starters, I've taken a story about my old friend, KB7HCW (SK) and broken it into three equal parts, converted the text into CW, and placed it on my website that's still under construction.

http://www.qsl.net/n7net/

At the bottom of the home page is place to click for the CW Blog. First, you'll need to wait about 30 seconds for the introduction to finish. In the next day or two I hope to have the plain text available to help those who are still in the early stages of learning CW.

This segment will be replaced in a week with part 2.

OK, now that I have your attention. As many of you know, BMHA is an affiliated club with the Adventure Cycling organization. Adventure Cycling has provided BMHA with 10 Adventure Cycling membership vouchers for a one year membership. They have also supplied me with 100 special edition Adventure Cyclist magazines.

Here is my shameless bribe. It is past time for a BMHA Newsletter and we need articles. One free membership voucher for each Newsletter article. First come, first serve. Only one each of course. Send your article to our BMHA Newsletter Editor, Norm, N9ZKS at n9zks@... or to me nf0n@...

These memberships vouchers expire in March 2010 so you need to get your BMHA article to us soon. If we have a deluge of articles, one of the magazines will be given. Since we have quite a few special editions of the magazine, I will make them available at the Dayton Hamvention BMHA forum.

BMHA articles can be short, long, or just lot's of pictures. Any will do.

Let's hear from you.

2199. Counterpoise a 20m ham stick

Yahoo group: BMHA
Date: 2010-01-22 18:24:30 UTC
From: n7net
Topic: 2199 Message: 2199

Does anyone have a length of wire that works well for them?

MFJ claims success with ham sticks using their MFJ-909. Has anyone had success using this on 20m and 40m with QRP power levels?

I've had some modest success by tuning the stick and then keeping my coax short and then leaving the tuner at home. But without an antenna analyzer and so much QSB I'm having trouble knowing if I'm making progress.

2200. Dayton Hamvention BMHA bike ride 2010

Yahoo group: BMHA
Date: 2010-01-22 20:25:23 UTC
From: Arnie Grubbs
Topic: 2200 Message: 2200

Hello BMHA riders!

I thought that I would put out the word that we are going to again have a BMHA -Hamvention bike ride on Saturday afternoon. I am looking forward to getting more people out on the trailthis year, and also more people displaying their human powered mobile hamshacks.
As of right now, we are looking at doing things the same time and place as last year, as seen on the BMHA web site at
http://75.60.24.163/BMHA/Timely/hamvention_ride_2009.htm
Looking at around a 3PM gathering time for eyeball QSOs and to check out the bikes, and a ride start of about 4PM. There is a very nice place to eat after the ride just across the street from the trail head parking lot.
I have been told by Mike, NF0N that there is the possibility that there is a bike shop with rental bikes very close to the trail, for those that might want to ride but will not be able tobring their personal bikes due to flying in or other travel concerns. More info on this as time gets closer..
I hope that you will give some thought to coming out and joining us on the trail!
Lets chat this up to others who might be interested but are not on the BMHA E-group.

Hi,

A menu has been added to the CW Blog. Scroll down near the bottom of the page and click on the telegraph key. That will open a window which reads:

Ernie pt 1 5 wpm
Ernie pt 1 15 wpm
Ernie text

You can print the text or display it on the screen. Maybe by summer you won't need a pencil. Instead, you can keep pedaling.

Ernie pt 2 will be available the middle of next week.

Bill,

Two meters is especially nice while on an extended tour. When you announce your call followed by Bicycle Mobile there's always a better than even chance you'll find bicycle friendly hams eager to chat with you. This will most certainly enlarge your adventure. It puts you in touch with birds of a feather, as you were, that can lead to a warm meal and/or a place to pitch a tent.

HF leads to an adventure of a different sort. Folks for afar are always interested in how you are powering your radio, what kind of antenna you're packing with you. QRP calms the power issue, but requires a little more patience on your part.

I'll be starting a similar adventure as early as the end of next month, following the Butterfield Overland Mail Road across Texas. If you're interested you can learn additional details by going to my Yahoo Group listed below.

Subject: [BMHA] Usefulness of ham radio on a tour

Everyone on this group will agree that putting a rig on a bike is fun. Working dx from your sleeping bag or chatting while in motion is exciting.
However, has anyone gone beyond the fun factor and actually found it to be a practical tool when on a self sustained tour? If so, how so?
I'm thinking of taking a several week tour and am trying to justify the added weight.
Please tell me of your experiences, pro or con.
Bill, WV1N

Bill,

I agree with Scott.

I've made 4 cross country trips and carried the 2 meter rig.

That means, a handi, a 25 watt amp and a 12 V 2.1 ampere gel cell battery available from Batteries Plus.

In fact, to me, weight just isn't an issue.

Since you're touring, loaded, you don't care about acceleration, I don't think.

I've not used a Bobb trailer but rather tour loaded with panniers.

It's like riding a semi.

Slow and deliberate.

Stretch out, enjoy the day.

The bike drives itself when it's loaded.

12-15 mph is a pretty good AVERAGE for me.

Like Scott says, at a minimum, you'll find local hams who will not only drive out to meet you, but likely as not be your host at a local restaurant lunch or dinner.

I've also found that other hams will often offer a place to sleep, either in their home or behind their barn, or in the back yard, and certainly a shower.

Be prepared to tell your story and be the center of attention in a home.

Meeting strangers and getting to know them is a big part of my touring and ham radio fills the bill.

I am such an oddity, dressed in tights and jerseys and Donald Duck walking cycling shoes, I've, more than once, early in the morning in a restaurant, been invited into the back room to dine with the city fathers - the mayor, district attorney, etc.

Think about it from their point of view.

They've never seen anything like you and probably will never again.

I wouldn't think of going without the 2 meter rig.

The cell is for the family and emergencies.

Speaking of which . . . .

when you need a shop, for any reason, someone will know where to go
and you don't have to spend energy riding around looking for the place.

Best,

Bill

Hi,
Bill here, W2QGA.

What frequency do you operate when you are going cross country on your bicycle?
146.520?
or do you program in some local repeaters?

I have a Trek 520 that I commute to work on and am about to outfit it with a radio.
2 meters sounds like a plan to me.
It's a 10 mile ride each way (the company is about to move)
Currently it's 20 miles each way and I do the ride once in a while but it's too much for every day.

Thanks.
Bill

From: Bill
Topic: 2206 Message: 2210

Actually, I use the local repeater, whenever I want to get on.

I use an ARRL repeater book which I keep in my handle bar bag, along with the radio, speaker mike, etc.

I have to point out, I usually don't have it on as there's lots of countryside between any two towns, regardless of where I am.

My main goal is to ride and enjoy the peace and quiet.

Ham radio is secondary and a fun way to meet people.

I have a good day at 100 miles but that's an average goal.

Believe it or not, I've a 1990 Bridgestone T 700 which is a true touring bike.

By that I mean, there's lots of space between the front of the rear tire and the seatpost, making a long wheel base.

It has a triple, the top two ring gears being half steppers which are "old school."

Three water bottle cages, braze ons for two spare spokes, etc.

But, I don't want to mislead you.

I have a Gary Fisher mtn bike and a Look road bike, which is my daily driver.

Once a year I go to GOBA.

See:

http://www.gobahams.org/BikeMobile.htm

and then scroll down to "How to wire a bike for ham radio.

Best,

Bill

2213. Re: [BMHA] Re: Usefulness of ham radio on a tour

Yahoo group: BMHA
Date: 2010-02-22 08:38:29 UTC
From: Jeff Newton
Topic: 2206 Message: 2213

Speaking of that, I recently picked up an MFJ-1721 Ultralight 2 meter antenna at HRO earlier this month, a ham buddy of mine also bought the same antenna for his van and wifes car as well to use with his radios. I was thinking of adding this same antenna to my bike mobile set up, but, I am looking for some metel ideas so, I can put the mag mount on the back of the bike - however, I just had a thought about maybe putting a piece of metal that is strong enough to go into my map pocket on top of my handle bar bag and mount it there as well, so, I don't have a problem with it, while getting on and off the bike?

Any ideas or suggestions here, folks? Scott N7NET, what you think?

I agree with Scott. Everyone now and than, even tho, I take a radio with me all the time, but, when I'm riding depending on if, I want to run the battery on it own power or take an emergency power battery with me, I can do that and just throw that brick into the handle bar bag, as the radio is in a side pocket on the bike and run the the power cords from the inside of handle bar bag to the radio and leave it on continueously without having to worry about losing my main power of my ht's own battery.

Even tho my antenna on my ICOM T-90A is a Tri-bander from Maldol and it just gives me the local 2/440 I need, otherwise, until recently, I'll throw in the MFJ-1721 Ultralight antenna and mag mount on the back of the bike if needed.

The radio's are useful when on tours, lets you talk to the locals and also the veteran hams you already know, especially of you go to another county and of course, if you close enough you've got a back up in case your cellphone goes belly up on its signal strength to the nearest cell tower. Remember its always good to alway program you local repeater's autopatch freq as well - just in case.

Hopefully, I will have pictures of my set up into the files ?

Bill,

Think of your radio as the "American Express Card - Never leave home without it". I do find biking and ham radio fun as well. People always ask me, what's with the radio gadgets on the bike, when you can do the same with a car - well, I give them a stare like, let's see here - The high price of gas and fuel, maintenace, insurance, besides my tires last longer, doesn't cost me an arm and leg to get a parking ticket or find a parking space, where you would normally find a bike locker or other suitable safe place to park you bike in full frontal view of your presence and most of ALL, its more fitness, than the car alone, unless I'm going to uncle charlies tuna fish party in Charleston, NC., than, I'll drive. ;)

Stupidty may think I'm crazy, but, if I can carry a radio like I can in a car, that's all that matters to me. Biking is fun, less traffic than those mean LA and NYC streets.

As for the radio being a practical tool - heck, I went on a bike ride once and I was looking for a great place to eat, several hams came up on the repeater suggesting the same place and a few others, I invited them to join me, some did, These guys were old timers and never seen a "bike mobile" ham before, but it literally gave them some ideas of their own as well.

That was the fun part. I not only, take it touring on day rides with me, but also mountain biking as well, it beats where my own department radio can't reach.

The mag mount antennas of which I'm familiar are all 5/8 wave and require a substantial flat area as a ground plane. Without this flat area your signal goes everywhere, even straight up, so I'm told. In spite of that I've used them on truck mirrors and bikes. They work until you're in a fringe area at which time no one can hear you.

I've never tried the MFJ-1401 ground plane kit, but it would probably work.

Lakeview Company., Inc. builds a 1/2 wave two-meter antenna that designed for motorycles, cars with plastic bodies, bicycles, etc.. It's called an HW-1.

You can also build or buy a 2m J-Pole made of 300 ohm twin lead and then put inside a piece of pvc. J-Poles are sometimes hard to tune. The SWRs keep coming back in spite of your best efforts. There's a way around this. Leave an extra couple of feet of coax in your lead and as near the feedpoint as possible make a coil of four turns in a five inch loop and secure the loop with zip ties. This will usually help keep the SWRs under control.

BTW I'll be retracing the path of the Butterfield Overland Mail Road across Texas in March or April. Most of it will be on a bicycle. The thrust of this adventure is to make contacts on 20m CW QRP. However, I'll also be monitoring 2m on 146.520. There are more details listed on the QNC Yahoo group shown below. I'll be adding more details as soon as I'm assured this winter has gone elswhere.

Subject: Re: [BMHA] Re: Usefulness of ham radio on a tour

Speaking of that, I recently picked up an MFJ-1721 Ultralight 2 meter antenna at HRO earlier this month, a ham buddy of mine also bought the same antenna for his van and wifes car as well to use with his radios. I was thinking of adding this same antenna to my bike mobile set up, but, I am looking for some metel ideas so, I can put the mag mount on the back of the bike - however, I just had a thought about maybe putting a piece of metal that is strong enough to go into my map pocket on top of my handle bar bag and mount it there as well, so, I don't have a problem with it, while getting on and off the bike?

Any ideas or suggestions here, folks? Scott N7NET, what you think?

I run a coaxial 2 meter 1/2 wave on my recumbent, no ground plan needed, works great.. I found it while I was looking for a better solution then a 1/4 wave mag mount.

look here http://www.mikestechblog.com/joomla/ham-radio/ham-radio-antennas-category/63-2-meter-antenna-for-bicycle-mobile-operation.html

Scott,

I've only used a half wave on 2 meters because it doesn't need a ground plane, only an odd multiple of a 1/4 wave length feed line.

I mount the antenna on a carbon fiber bike (both 1986 and a 2000 iterations).

We've also tested a 5/8 wave with a "ground plane" on a steel frame touring bike. The ground plane is an aluminum plate, 14" long and about 6" wide, strapped to the top of a rear, "top bag" rack.

Attached to the underside of the soft aluminum mounting plate are 4 wires, each a 1/4 wave length.

We tried both coiling the wires and stretching them out along the frame. Both ways work equally well.

Both work equally well on either a carbon fiber or metal frame bike.

For the specific application as we have, we use the half wave as it's simply more efficient to substitute parts or switch out the whole system. It's our standardized recommendation which many of the hams use.

There's a way to get to the article about this set-up, here on BMHA, but I don't know how to get there.

Perhaps someone can help.

However, if you Google GOBA Hams, that's the Great Ohio Bicycle Adventure, click on Operations, then Bike Mobile and half way down the page click on "How to Wire a Bike for Ham Radio," . . . .

it will show you two things:

1. The half wave doesn't require a ground plane to operate well.

2. It's pretty easy to set-up.

Long ago, Larsen, worked with us and designed a feed line specifically for our application.

They gave the results of our research model numbers GBR-1 and a GBR-2. These are for single and tandem bikes respectively. With testing, we found that adding a strain relief at the BNC connector end and an NMO connector at the other end worked best for us.

While these are no where to be found in their catalogs, the engineering department has the models and specs on file. Larsen custom

makes them for each order.

I hope this helps a little.

Best,

Bill

Guys,
Thanks for all the good ideas. It seems that vhf, and specifically 2m, is the most practical rig to bring.
I like the J pole idea. It probably beats my other idea of covering my helmet with tin foil to serve as a ground plain for a 1/4 wave. I thought that mounting a neon at the tip might add a dash of panache when I transmitted. But 19 inches of foil would make my head sweat too much.
Also thanks for the water bottle battery idea. Maybe I can split an old bottle and stuff in some NiMH cells. Does anyone charge off of a front wheel generator? I guess with a 2 m rig I can find a place to charge them.

IF I was taking a week long trip (bike or hike) I would take a HT with APRS/GPS. APRS is more then tracking (aka GPS) so that friends can see where you are. See http://aprs.fi/? ... APRS is also texting and email. See http://www.winlink.org/aprslink ... I have been using a mobile rig with APRS for a number of auto trips for tracking/email (weight not an issue). Yeasu has an HT and Kenwood is planning on re-introducing its HT this spring.

Con = APRS HT's use VHF that depending on trip may have a range issue. see aprs.fi to determine if in range.

Everyone on this group will agree that putting a rig on a bike is fun. Working dx from your sleeping bag or chatting while in motion is exciting. However, has anyone gone beyond the fun factor and actually found it to be a practical tool when on a self sustained tour? If so, how so?
I'm thinking of taking a several week tour and am trying to justify the added weight. Please tell me of your experiences, pro or con.

You probably don't want to mount the antenna on the front of the bike. Unless the antenna is pretty rigid, it's going to sway back and forth as well as side to side with pedaling and bumps in the roadway. this is going to be more than a little distracting to say the least. My antenna is mounted on the very back of the rear carrier, and it sways enough that I occasionally feel a tap on my shoulder from the antenna tip. If this were in front of me, I'd be getting tapped in the face regularly.

The antenna I'm using is a Tram 1180 dual band antenna. It's 1/2 wavelength on 2m, and stacked 5/8 antennas on 70cm. I've bolted a flat aluminum plate to the underside of the rear carrier. the plate projects out a few inches back of the carrier where there's a hole for the NMO antenna mount, and a mounting hole for my rear light as well.
The radio is a Kenwood TH-D7A mounted on the handlebar using a RAM mount. It connects to the antenna via a length of RG-174 cable run along the frame of the bike, and also via a serial cable to the GPS. I'm normally beaconing APRS on the 2m side while keeping the 70cm side available for voice, but I can use voice on either band. Power for the whole setup comes from a 7AH gel-cell hidden in one of the packs. It used to be located in the handlebar bag, but last year I relocated the battery to a frame pack. I find keeping the weight off the handlebars makes the bike handle a bit easier.
I use a lightweight headset with the radio. The speaker is an earbud tucked under the helmet straps to my right ear, (keeps the left free to listen for passing vehicles) with the microphone and PTT clipped to the tail end of my helmet chin strap.

There's a couple pictures of the setup in with the other photos here:
http://www.peelarc.org/images/photo_albums/fd2008/

I do like to at least monitor the local repeaters while out cycling. I also use the radio to check the weather broadcasts. While I do chat with people occasionally, about the only time I do a lot of talking is when I'm doing a bicycle patrol for one of the charity events the local club is assisting with.

Or in my case, I >prefer< to have the antenna on the front of the bike (on the rear, I tend to kick the poor thing when mounting and dismounting).

I'm concerned that any antenna mount (front or rear) is likely to stress the connector unless it is much more of a robust "mobile" mount.

My solution is to "guy" the antenna -- starting low near the fork (I use the straps of a front handlebar bag which guy to the front dropouts), and extending through a "guy" which is a loop in some string extending between the brake hoods.

The resulting antenna is fairly low, but holds even a half-wave "hotrod" without strain or sway and doesn't put any stress on the radio's connector at all.

From: S. Earl Jarosh
Topic: 2206 Message: 2224

The summer before last I and a friend rode around Lake Superior 1409 miles 25 days 21 riding. You can read about the plan here: www.jarosh.org and my daily journal here: http://jaroshs.home.comcast.net/~jaroshs/journal.html There are several pictures and if you look hard you will see a 5/8 wave mounted on the back of a Avenir alloy rack via NMO mount. If you go into the files section on the yahoo group you will see pictures of my old bike with a 1/2 wave marine antenna again on the rack. My results have been roughly the same between the two installations with a little better on the 5/8 wave. As long as you have a metal rack that has positive metal connection to the bike, it does appear that there is enough metal ground plane mass. This placement does two things; it keeps the antenna whip from banging my head and also out of the way enough to mount the panniers.

The radio was a TH-79AT handi-talki with the big battery for 5 watts. My main purpose for talking it was to pickup the weather reports daily. I did make some occasional ham contacts however the Canadian side of the lake is very spotty once you get east of Thunder Bay. The antenna did become a bit of a conversation starter at times I hope to do a coast to coast ride and once again with have the radio with me. Even in my daily rides it is with me.

Skip, I had seen your article many times in the past, in fact, I like your set up of having the antenna up front near the handlebar bag. I am trying to figure out how to do that with my MFJ-1721? I'm still leaning toward that back of the luggage rack at this point. How, I want to approach that, I don't know at this point? Ideas are abounded and possibilities are being considered.

An NMO route would be one idea, but, not enough metal is there for such a project. Adding a truckers mount and a piece of sturdy metal to the back at the opening portion of the mount would work - but, I would need to find a strong enough metal to work with the magnet.

Any ideas?

I checked with Larsen a few months back about ordering some of these mounts for GOBA to make available to our riders. Larsen is no longer doing the custom order bit on these. I think any of our builders out there can use the information in the article to craft one of the coax setups themselves. Here's the link to the article:

Thanks Jeff for this info.

I'm sorry to hear Larsen too has apparently had to cut back on "going the extra mile."

Would you be kind enough to change my e-mail address in the little yellow box to goba@... ?

No need to miss questions and comments.

Snowing again here this AM.

It's not sticking but lots of folks are staying off the roads.

It's a different world.

Getting back to OH each year for GOBA gives me a perspective.

Ha.

When I first set up my bike for 2m/70cm, I decided to use the Diamond NR770NMO which uses a NMO mount because not only did it not require a counterpoise, but it also has excellent gain. Yes, it's a fairly tall antenna but has a foldover radiator so the bike can be easily stored in a low-ceiling garage, etc. (or if you're riding in some heavy forestation with low branches, etc.) I've been able to hit repeaters over 120 miles away with my 5-watt handheld and this antenna. I do have the antenna mounted on my bike rack with a steel extension bracket so it's mounted about 1-1/2 feet above the rack (helps to get it above me somewhat for better performance). Checking it with the MFJ antenna analyzer shows that this antenna is not picky about coax length either.

We don't have the challenges you guys do with snow, etc.; we only have to contend with rain once in a while; unfortunately riding around in circles on an island is not as exciting as going cross-country or cross-state.

Although I'm still using a mirror mount on my rear rack with the antenna I took out of my MFJ Magnetic mount. a buddy of mine did what you want to do. He bolted a piece of metal to his rear rack by simply drilling straight through the metal and the rack. Then just use nuts, bolts and lock washers to complete the installation. His metal is 1/8 thick and runs the entire length of the rack. It has made is rack stronger without adding much weight.
Enjoy

I'm working on a mount for my bike. If I use a continuity meter and put one lead on my bike rack and the other lead on various parts of my bike the meter indicates a "short".

So... wouldn't the bike frame itself provide some sort of groundplane for any type of antenna mounted off of the rack??? A 1/4-wave radial for 2m is only about 19 inches... and the bike frame is longer than 19 inches.

Maybe I'm missing something here. The only thing that I could see would be... the radiation pattern not being omni-directional.

With antennas, bigger is always better. It's only the applications that get in the way - smaller to fit somewhere.

For bicycle mobile use, research has proven that radiation is best with a 5/8, then 1/2, then 1/4, and so on. J poles fall somewhere along that continuum.

Using a 1/4 wave is just a step up from a duckie mounted back there, in my opinion.

But hey, use what ya got or build a J pole to put on a flag mast.

With a marginal ground plane at best, and not much power (remember to multiply by 4 to get an s unit difference) 1 watt vs 5 vs 30, it's sometimes a challenge to hit many "low profile," local repeaters where some say more friendly people lurk.

2236. Re: Add Metal to the bike

Yahoo group: BMHA
Date: 2010-02-25 18:03:24 UTC
From: AOX
Topic: 2231 Message: 2236

Anything you do for an antenna will work, some better than others. The bike frame is INDEED longer than 19 inches, but try finding a mounting place that provides 19 inches (or anything CLOSE) on EACH side of the antenna.
When we find our desired sweet spot for an antenna, most of us encounter the following "minor details":
-The antenna cramps our access when mounting or dismounting the bike (especially if mounted on the back somewhere)
-The antenna whips back and forth, and occasionally (or more often) whangs us in the face if mounted up front, especially making turns
-We note, especially with a rubber duck or 19" whip, that the antenna is very close to our butt or back or both and does not even stick up above our heads, and
-We note the resultant loss of signal when our blubber, er, body mass, gets between the antenna and the station we are trying to talk to
Most hams like the antenna to be as high as possible and in the clear as possible. (This, because, for some reason, the radio seems to work better that way) Thus the tendency for cyclists to use ½ or 5/8 wave antennas of all stripes.
I use a 3 foot length of ½" PVC or fiberglass pipe clamped to the rear baggage bracket and lower frame of the bike, slanted to the rear at 30 degrees or so, and drop the end of my 6 ft. homebrew J pole into the pipe while riding it gives me a bit more "kick room" when getting on and off the bike. The J pole, while decried by many, has served me well for over 30 years and most of the radiator portion of the antenna is above my head, adding visibility AND virtual height for the antenna. And it's easily stowed when racking the bike on the back of the commuter-car.
I have also used a 19" springy-wire antenna purchased at Dayton, with NO radials, just plugged into the top of the HT clipped on the back of the bike, and it worked well for years until it disappeared during one of my rides and I haven't yet spotted another one at Dayton. Almost anything will work better than the original HT antenna .
I have also used the stock HT rubber ducky antenna and it also "worked", occasionally getting through the QRM to report one or two positions on APRS during a 10-mile ride, and no one being able to hear me on voice unless they were within a mile of me. Thus my fondness for the J pole and other longer antennae.
Others like 5/8 wave antennas or dual or tribanders such as the Diamond 320?
Purists worry about the lack of proper decoupling and grounding because the desired 19" metallic surface is not available in the desired area . At the base of the antenna and high enough to clear our punkin heads and far enough apart from the rider's position to be able to ride comfortably. Thus the continuing discussion of ground and lack thereof.

2237. Kenwood D-7 mount (was Usefulness of ham radio on a tour)

Yahoo group: BMHA
Date: 2010-02-25 17:56:10 UTC
From: Barry Bogart
Topic: 2237 Message: 2237

I use APRS routinely on tour. You will see me as WV2J-7 on TOSRV before Dayton and on my tour to Buffalo after it. I usually use the Larsen 1/2 with it.

But on this Dayton trip I'll be using a folding bike, which complicates mounting. I used to just attach the D-7 on the top tube near the stem with a hose clamp through the belt loop, but this bike has no top tube! (http://www.asamabikes.ca/bikes.php?id=17). A posting here (I think by ve3vgp) referred to some 2008 FD photos including a Kenwood D-7 mount on a bike, (in picture 13). I hope that the owner of this bike is on this list and will contact me. Or maybe someone else has found a way to mount a D7 securely on a handlebar?

2238. Re: [BMHA] Re: Add Metal to the bike

Yahoo group: BMHA
Date: 2010-02-25 19:04:13 UTC
From: n1evh@verizon.net
Topic: 2231 Message: 2238

As stated... I DO see a short between the rack and the bike frame.
I said if I place one lead of the continuity meter on my bike rack and
place the other lead on various parts of my bike... the meter shows
a short.

My current plans are....

1) Use a 1/2" x 1" piece of aluminum stock that is about 18 to 20 inches
long... mounted up as high as I possibly can on the side of my rack
and so it sticks away from the back of the bike a little.

2) At the end of this piece of aluminum, mount an "L" bracket that I have
from an old scanner antenna. The bracket has holes drilled into it for
U-bolts... so I was going to use 2 of the holes (1 set) and use
stainless
steel 1/4-20 bolts to mount the bracket to the piece of aluminum

3) the bracket originally had an 3/8-24 to SO-239 adaptor for the scanner
antenna. I drilled the hole out and out a 2" UHF "bulkhead" adaptor on
it so I could put a dual-band antenna on it (I figured my Diamond CR627B
6m/2m/70cm antenna would be a tad bit too big to use at 60 inches tall).

The top piece of the aluminum "L" bracket is probably big enough if I
wanted to drill it out for an NMO mount.

Current plans are to use either my VX-7R or my TH-D7A(G) (if I want to
run APRS)... unless I can come up with a good way to mount my FT-817
(but 2m SSB probably wouldn't be that great with a mobile vertical antenna).

2239. Re: Kenwood D-7 mount (was Usefulness of ham radio on a tour)

Yahoo group: BMHA
Date: 2010-02-25 19:23:06 UTC
From: AOX
Topic: 2237 Message: 2239

I'm not the guy you're asking about, but I do use a RAM mount for my TH-D7 between the handlebars of my bike. It appears RAM no longer makes specific mounts for the 'D7 (now marketing a so called "universal mount" that appears to be designed primarily for cell phones).
As a presenter of a BMHA forum at Dayton 2 years ago, I purchased a dozen of these RAM mounts with the sleazy idea of selling them at Dayton..... and, of course, left them behind when I whizzed away in a cloud of smoke for Dayton. I still have 2 or 3 left, and would gladly sell them for what I THINK paid for them: $12 not including shipping to your address. The D7 is starting to fade, so if no one buys these RAM mounts from me soon I will start giving them away in hopes of them actually getting used by someone interested. My D7 RAM mount is set up on a removable bracket that also holds my Magellan GPS and ITS associated RAM bracket. I move the entire D7/GPS assembly from bike to bike, and thus have no need for extra RAM mounts.
I wish RAM still produced specific mounts for specific radios, as I'm getting weird ideas about trying to upgrade to a VX-8R...

>
> But on this Dayton trip I'll be using a folding bike, which complicates mounting. I used to just attach the D-7 on the top tube near the stem with a hose clamp through the belt loop, but this bike has no top tube! (http://www.asamabikes.ca/bikes.php?id=17). A posting here (I think by ve3vgp) referred to some 2008 FD photos including a Kenwood D-7 mount on a bike, (in picture 13). I hope that the owner of this bike is on this list and will contact me. Or maybe someone else has found a way to mount a D7 securely on a handlebar?

2241. Kenwood D-7 mount (was Usefulness of ham radio on a tour)

Yahoo group: BMHA
Date: 2010-02-25 22:16:26 UTC
From: Jay
Topic: 2237 Message: 2241

When I did my east coast bicycle trip, I used on of these mounts designed for the garmin gps 12. In fact, the gps sat right next to my thd7 on the same mounting system.

http://www.amazon.com/gp/aw/d.html/ref=redir_mdp_mobile/182-7855774-5101708?a=B0000ADX9E

This mount is bulletproof and does not come off or slip. Use a 2 gallon ziplock bag to hero it protected from rain and weather.

As far as the antenna, I went with a "throught the glass" model 1/4 wave, and just stuck it to it self off the back of my pannier rack. Zip ties held it all to the rack. Worked fine for about 8 miles of simplex, however I did frequent the active repeaters as well. A great place to ask for a good dinner place.

Bigger antennas pose several hazards to you as well as others if they are wagging around in the wind or rough terrian, all of them right about eye level..which you tend to forget about after a 100 mile plus day when you are bent over reaching into you bags pulling you gear out for the evening.

Powered everything from a battery in one of the pannier bags.

Worked slick fom Canada to Key West.

2242. Antenna type

Yahoo group: BMHA
Date: 2010-02-26 16:08:53 UTC
From: W1RO@aol.com
Topic: 2242 Message: 2242

I see someone mentioned using 1/2 and 5/8 wave antenna on the bike.
I have 2 different 2 meter antenna depending on I'm riding conditions.
If I am in the city I use a 1/4 that I took off of an MFJ mag mount. If
I'm going outside the city to one of our more rural areas I use the
Hustler Colineer 80 inch antenna. Yes, it will sway an it also puts out
a great signal. When I used to commute 10 miles to work the 80 incher
swaying behind me caused the city bus to move over one lane to pass me.
Prior to that they would put their mirror inches away from my helmet.

Which antenna used is dependent on many things and that is one of the
great things about ham radio. The challenge of figuring out what works
for each installation.

> Bill,WV1N

Bill:

For VHF/UHF, I am a fan of using a fiberglass bike flagpole with a jpole or coax-dipole zip-tied, taped, or shrink-wrapped to the pole. The poles are lightweight, pole+antenna works with all frame materials and types and your bike will be easy to spot. It's worked very well when I've helped with bike mobile comms support for several century rides - much better than even a long whip on the radio itself. (And I've stopped worrying about losing my few shreds of roadie cred with the only carbon-frame bike with a bike flag!)

Decide if you are going to operate in motion (headset, PTT on handlebars recommended) or not. If you are going to use the rig in-motion, be absolutely certain nothing can fall off and tangle up in the wheels or drive train. Raamm makes a great universal radio/phone mount for bikes. Also, make sure you have a fool-proof way to disconnect anything attached to you from anything on the bike (I've trashed 3 headsets this way when I forgot!). Bluetooth may be the way to go if you can manage the headset power/recharge. There are aftermarket b/t adapters for some rigs and a few new ones offer b/t as an option.

For a long trip, I think a rig that can run, even at reduced power, from AA batteries is nice to have. As long as you aren't out in the woods, AA batteries are ubiquitous.

My one experience with HF & VHF on a tour was a 5-day C&O Canal trip with my son's Scout troop. If I were to do it again, I'd get much more serious about gear weight, bring earbuds and plan on CW-only. Once it gets dark, voices carry and I got a lot of semi-good-natured grief from the other adults about my CQ attempts (QRP SSB on 80& 40M with a short antenna from bottom of a river valley is a bit nuts anyway). A simple wire antenna (plenty of trees) would have weighed less and hopefully as easy to deploy as my MP1+MFJ 12' whip and counterpoise wires. There are some fantastic trail-friendly CW QRP rigs out there, esp. if you can build a kit or have a friend who can do it for you.

The HT came in very handy on the same trip as it had weather radio coverage and we had a couple of days with thunderstorms. Knowing what was coming was a big help.

If I was riding solo with hamming part of why I was going, and I could stop to operate midday, SSB on higher bands with a quick setup vertical or end-fed wire could work well.

For HF, I'd carry a list of the HFPack operating frequencies and if going someplace rare, nets like County Hunters. I see announcements of trail ops on QRP-L and HFPACK, so you can ask people to look for you.

I recently acquired a VX8. In theory, this gives me everything I'd want for a bike-mobile VHF/UHF radio: size, power, weather resistance, GPS, some APRS capability, b/t headset. I have yet to figure out APRS text messaging and the GPS greatly reduces battery run time. Have not tried b/t yet, might be great if the headset runs long enough between charges.

I have no 1st-hand experience with bike generators; assuming there are any that put out enough juice. Velo Orange sells a 6v 3w sidewall generator http://www.velo-orange.com/spdy.html that *might* work with a voltage multiplier, a regulator, and some patience. if nothing else, you can power a light with it. They also sell a front hub generator http://www.velo-orange.com/nodyhub.html rated at 6V 3W.

I don't have any experience with current bottle / sidewall generators but back in the 1970's I used the older style garden variety headlamp sidewall generator for limited use on 2 meter FM from the bicycle.
What always bummed me about such generators was the very noticeable increase in drag when the generator was flipped over to rub against the tire and produce electricity. I found I preferred the additional weight of more batteries than the demoralizing feeling of slowing down or increasing drag when running with the generator activated.
Those old generators were in fact permanent magnet alternators, meaning they put out AC, which would peak at over 8 volts or so depending on speed, and simple full wave rectification produced enough voltage to charge a 12 Volt Nicad pack.
The ones listed in the previous post look interesting and different enough to blow 20 bucks and play with a modern one, just for grins.
Thanks for the idea. Commuting for an hour or so morning and night presents no problem even running the electronics on internal batteries. But longer or cross country trips..... gotta cover the chances that you won't always have access to commercial AC power.
I've also run small solar panels on the bike but do not dare to leave such things hanging on the bike when I lock it in the rack at ANY store. And I have too much STUFF to drag off the bike and haul into the office when I get to work already..... so I currently stick to a couple of home made C cell 12 Volt nicad or NiMH packs.

I've had a solar station with 4-75w panels from 1999 to 2005. I used a 21w unit on my camper. But they are all too big for a bike.

I bought a small one on ebay but it was of no use. For QRP I've found that D-cells are my best bet.

When touring, I had a 5 W amorphous panel that I hung on the sun facing side of the panniers with a bungee cord. It fed directly into a 12v 7AM gel cell. Worked great.

A crystalline 10W panel would now be smaller and I'd probably strongly consider that before heading out on a great adventure.

Ok... I know I am being a bit anal retentive butt....LOL
If I am riding .... I am bicycle mobile
But what if I rode to get to the location and carried my rig with me and then I set up my rig and toss an antenna into a tree. Am I still "bicycle mobile"? What if I rode most of the way carrying my rig then parked the bike and hiked the rest of the way then set up the rig?
What if I rode all the way but the rig was delivered by car and set up for me....LOL
Okay. Just trying to be funny there but seriously.
I want to be reasonable, I already have VHF/UHF/6 Meters on the bike but I want to go bike/pack mobile on HF. The question is .... is it still "bicycle mobile" if I have to stop and hang and antenna to make it work?

Thanks for all the input I am sure I will recieve?

If you are riding while you are conversing, you are "bicycle mobile".

If you are sitting on your bike while stationary, you are "bicycle mobile".

If you are off the bike and sitting on a park bench with an antenna in a tree... you are "portable"

If you are off the bike and hiking (carrying the antenna).. then you are "pedestrian mobile"

How does that sound?

Jay,

Well, you kind of have to be moving to be mobile.

I do QRP VHF and HF. Everything is on the bike or trailer, but I'm stationary for safety issues. I call it Bicycle QRP Portable. But sometimes I simply do a qso and let it go at that. However, if the strength of my signal becomes the topic I then announce that I'm using 8 D-cells and a vertical antenna mounted on a bicycle trailer.

>>Jay,

>>Well, you kind of have to be moving to be mobile.

If you are in a parking lot in your truck, having just climbed in with a bunch of supplies from the store, turning the key to get the engine running.. are you mobile or portable? I would say that you are mobile.. (or soon to be mobile), you just happen to be not moving at the moment.

Or.. if you are driving and hearing some rare DX.. and you pull over on the side of the road to hear better... are you "mobile?"

We are discussing semantics now.. ;-)

Keep the wheels spinning.. we are looking at 44 degrees here this weekend.

Yeah, I'd agree you may well be a bit, er, retentive here.
If it was me I'd be sorely tempted to ID as "Bicycle Mobile" while in motion OR sitting still, operating from the bike with the bike antenna doing the radiating.
If I rode the bike somewhere and stopped and threw up a dipole or whatever and took a radio-break I'd suggest ID'ing as "Bicycle-Portable". Not only does it provide you a few well deserved bragging rights but also an attention-getter when trying to make contacts.
When walking, I ID as "W5AOX Foot-Mobile", or "Hoof-Mobile". When biking I ID as "W5AOX Bicycle-Mobile".
Few hams change their ID from "Mobile" to "At Rest" when stopped at a traffic light or elsewhere.
As usual, Your Mileage May Vary.
Keep a firm hand on the "DELETE" button and act promptly when you get any responses that include "You MUST do This or That .. yada, yada."
Other rude suggestions:
"Bicycle Mobile taking an oxygen break"
"Bicycle Mobile on the Top of the Continental Divide"
"Huff-Puff Mobile"
"Bike-Mobile at Camp"

Every year since 2004 I've participated in Field Day in the 1C class. That is referred to as mobile.

"4.5. Class C (Mobile): Stations in vehicles capable of operating while in motion and normally operated in this manner."

Probably as good of a definition as possible. My reading of this says that you don't necessarily have to be in motion to be a mobile as long as you are capable of being in motion.

Personally I only count contacts I make while in motion on the bike. This is the same handicapper mentality that justified fighting the school bully with one hand behind my back. Yes, it's some sort of personality disorder.

Just as an aside it always cracks me up when there is a picture of an operation on the Soapbox portion of the web site. One year there was a guy with a tri-bander and tower anchored to his van and a very, very long, long wire trailing off into the forest. There was also a big arsed genny parked next to the van. I don't think that this is what ARRL had in mind when they established C class.

The beauty of the whole thing is that since we are the mighty BMHA we can make up any designation we want. Who's to argue with us?

BTW, anybody planning to do Field Day this year as a bike mobile? I could use some competition to sharpen my game.

My 2.5 cents worth (inflation from 2 cents worth).

I operate Tricycle mobile and my rule is when in motion and when stopped
and capable of being in motion without modifying my station i.e. taking
antenna out of trees, I consider myself Tricycle mobile. If I'm not capable
of getting on tricycle and riding off into the sunset like Randolph Scott
used to do, I am Tricycle Portable. IMHO
I will be operating Tricycle mobile and QRP during field day at least
until I get tired or battery dies whichever comes first.

Nah Scott, you can call it anything you want ... especially if you use the ARRL Field Day definition as a base. Just remember that guys sitting in the back of their RV with the jenny all revved up to keep the AC running full blast are "mobile" class cuz they actually could be in motion within moments.

On FD I log on a digital recorder. It has a date/time stamp that I set to GMT so all I need do is yell out the call, section and operating class. I run out of battery at about three hours so I come home have an 807, switch batteries and log the Qs on an Excel spreadsheet.

This year; 300 Qs and 100 miles. Been singing that song since 2004. But remember, I'm from Chicago so "wait till next year" is inbred.

2266. Re: [BMHA] Re: Add Metal to the bike

Yahoo group: BMHA
Date: 2010-03-06 06:26:09 UTC
From: Ted Burris
Topic: 2231 Message: 2266

My son and I have been bicycle mobile on VHF/UHF for several years now. We use a 5/8 wave dual band antennas mounted on a homebrew rack extension a few inches off the back of the rear rack and they have been awesome. In December I upgraded my license to General and am in the planning and parts purchase stage of adding HF to the bike. I have upgraded to a VX8DR with APRS for the VHF/UHF and this will be its first year on the bike so we will see if its as tough as its predecessor (the VX7R) that I took off to make room for it.
I have not decided on an HF rig yet..... I love the IC7000 but fear it might not take the beating that bicycle mobile can dish-out.

One note - we tried one antenna mfg. at first whose antenna used an air wound suspended core. This design could not take the vibration and abuse dished out by the stiff ride of a bicycle with no shocks. I would shy away from antennas of this design.

Now... almost time for Huff and Puff mobile......

Ted - KB0MRC

Subject: [BMHA] Re: Add Metal to the bike

Anything you do for an antenna will work, some better than others. The bike frame is INDEED longer than 19 inches, but try finding a mounting place that provides 19 inches (or anything CLOSE) on EACH side of the antenna.
When we find our desired sweet spot for an antenna, most of us encounter the following "minor details":
-The antenna cramps our access when mounting or dismounting the bike (especially if mounted on the back somewhere)
-The antenna whips back and forth, and occasionally (or more often) whangs us in the face if mounted up front, especially making turns
-We note, especially with a rubber duck or 19" whip, that the antenna is very close to our butt or back or both and does not even stick up above our heads, and
-We note the resultant loss of signal when our blubber, er, body mass, gets between the antenna and the station we are trying to talk to
Most hams like the antenna to be as high as possible and in the clear as possible. (This, because, for some reason, the radio seems to work better that way…) Thus the tendency for cyclists to use ½ or 5/8 wave antennas of all stripes.
I use a 3 foot length of ½" PVC or fiberglass pipe clamped to the rear baggage bracket and lower frame of the bike, slanted to the rear at 30 degrees or so, and drop the end of my 6 ft. homebrew J pole into the pipe while riding… it gives me a bit more "kick room" when getting on and off the bike. The J pole, while decried by many, has served me well for over 30 years and most of the radiator portion of the antenna is above my head, adding visibility AND virtual height for the antenna. And it's easily stowed when racking the bike on the back of the commuter-car.

I have also used a 19" springy-wire antenna purchased at Dayton, with NO radials, just plugged into the top of the HT clipped on the back of the bike, and it worked well for years until it disappeared during one of my rides and I haven't yet spotted another one at Dayton. Almost anything will work better than the original HT antenna….
I have also used the stock HT rubber ducky antenna and it also "worked", occasionally getting through the QRM to report one or two positions on APRS during a 10-mile ride, and no one being able to hear me on voice unless they were within a mile of me. Thus my fondness for the J pole and other longer antennae.
Others like 5/8 wave antennas or dual or tribanders such as the Diamond 320?
Purists worry about the lack of proper decoupling and grounding because the desired 19" metallic surface is not available in the desired area…. At the base of the antenna and high enough to clear our punkin heads and far enough apart from the rider's position to be able to ride comfortably. Thus the continuing discussion of ground and lack thereof.
Jim W5AOX
http://aprs. fi/?call= W5aox-6 Bike-mobile

Somewhere in time, a subscriber put it thusly:
"I'm working on a mount for my bike. If I use a continuity meter and put one lead on my bike rack and the other lead on various parts of my bike the meter indicates a "short".

So... wouldn't the bike frame itself provide some sort of groundplane for any type of antenna mounted off of the rack??? A 1/4-wave radial for 2m is only about 19 inches... and the bike frame is longer than 19 inches.

Maybe I'm missing something here. The only thing that I could see would be... the radiation pattern not being omni-directional.

Mike - N1EVH"

Topic: 2251 Message: 2267

Okay, here's my 2 cents.

If you're "capable" of operating while mobile (ie. The rig is mounted/configured in such a way as to permit operation), then it should be "bicycle mobile". It requires a stop and other equipment to be mounted/connected, then you're "bicycle portable". The same holds true for pedestrian, maritime, aviation mobile/portable. I think that makes the most sense, logically speaking, and is easiest to understand. There is no "must" or "shall" to it. Just your own honest interpretation of your unique situation. When I'm riding really hard on my racking bike, I'm quite capable of being "bicycle mobile", but because I choose to only operate when I'm resting doesn't take away the capability. On the other hand, when I'm on my touring recumbent trike and choose to operate HF, I must come to a stop and throw up an antenna in a tree. Therefore, I'm never "capable" of operating HF Bicycle Mobile, only HF Bicycle Portable.

Jack KE4LWT and Suzy KD5YBF

Bicycle Mobile on VHF, Bicycle PORTABLE on HF.

Yeah, I'd agree you may well be a bit, er, retentive here.
If it was me I'd be sorely tempted to ID as "Bicycle Mobile" while in motion OR sitting still, operating from the bike with the bike antenna doing the radiating.
If I rode the bike somewhere and stopped and threw up a dipole or whatever and took a radio-break I'd suggest ID'ing as "Bicycle-Portable". Not only does it provide you a few well deserved bragging rights but also an attention-getter when trying to make contacts.
When walking, I ID as "W5AOX Foot-Mobile", or "Hoof-Mobile". When biking I ID as "W5AOX Bicycle-Mobile".
Few hams change their ID from "Mobile" to "At Rest" when stopped at a traffic light or elsewhere.
As usual, Your Mileage May Vary.
Keep a firm hand on the "DELETE" button and act promptly when you get any responses that include "You MUST do This or That ... yada, yada."
Other rude suggestions:
"Bicycle Mobile taking an oxygen break"
"Bicycle Mobile on the Top of the Continental Divide"
"Huff-Puff Mobile"
"Bike-Mobile at Camp"

I agree with you jack.

My entire VHF and HF station is both mobile with a j-pole and hamstick, but I choose to operate portable for ease of logging and safety reasons.

Subject: RE: [BMHA] Re: Please Define Bicycle Mobile

Okay, here's my 2 cents.

If you're "capable" of operating while mobile (ie. The rig is mounted/configured in such a way as to permit operation), then it should be "bicycle mobile". It requires a stop and other equipment to be mounted/connected, then you're "bicycle portable". The same holds true for pedestrian, maritime, aviation mobile/portable. I think that makes the most sense, logically speaking, and is easiest to understand. There is no "must" or "shall" to it. Just your own honest interpretation of your unique situation. When I'm riding really hard on my racking bike, I'm quite capable of being "bicycle mobile", but because I choose to only operate when I'm resting doesn't take away the capability. On the other hand, when I'm on my touring recumbent trike and choose to operate HF, I must come to a stop and throw up an antenna in a tree. Therefore, I'm never "capable" of operating HF Bicycle Mobile, only HF Bicycle Portable.

Jack KE4LWT and Suzy KD5YBF

Bicycle Mobile on VHF, Bicycle PORTABLE on HF.

2269. Which antenna for HF QSO Party as a mobile/portable?

Yahoo group: BMHA
Date: 2010-03-08 03:12:42 UTC
From: BrassRat77
Topic: 2269 Message: 2269

I'm hoping to operate the VA QSO party in 2 weeks as either a bike mobile or portable (rules call portable "expedition" class). Probably just SSB. Rig will be my FT817, likely using internal batteries (2100 mAH low discharge rate AA NiMH cells or single use AA lithium) unless I have time to put together a better external pack.

Rig mount is taken care of as long as it isn't raining and I need to keep everything dry. A Minoura Space Bar extension bar off the handlebar, and a mount for the 817 mounted to the Minoura with hose clamps. Mechanically solid and looks decent. I can rest or attach a stiff pad of paper or small spiral notebook to the space bar for logging or provide a resting place for a small key (stationary - can't copy code by ear!).

Considering 3 antenna options, supplemented with a a manual ZM2 or automatic Elecraft T1 tuner.

1. MP-1 on mirror mount bolted to rear rack. I've used this before with limited (I made a QSO) success. I use a slightly longer base rod and a 4' whip salvaged from an old 2M antenna. Capable of operation in motion. I can swap a 3' base rod and 12' telescoping rod (MFJ) for better performance (in theory), I might try riding with the longer base rod but the 12' rod is stationary use only.

After checking the mechanical fit this weekend, I'm probably going to stay with the MP-1. Lightest, simple, usable on at least 40-6M. The other two options I was considering will take some work to mount:

2. Attach a 20ft "crappie pole" (SD20 type) to bike and run a wire up to the top, end-fed through one of the tuners. Might be able to use this in motion (with tape or hose clamps to keep the mast up) with 2 or 3 sections extended. Not sure it is worth the effort for not much more antenna - max ~20' of wire vs. a 14' modified MP1.

3. Use a 31ft Jackite pole instead of the SD20. Heavier (but manageable) but I think the additional wire would prove helpful. Weird looks from passers-by when operating assured! Maybe I'll have time to try to set this up before the 20th.

If I want more than a 18" whip for 2M, I will use a flagpole j-pole. Unless I climb a parking garage or ride 90 minutes each way to the peak of a local bike path, I'm not going to have much height advantage.

Comments on these antenna options? Has anyone tried mounting a telescoping fish rod or kite pole to a bike? I was thinking the way to try this is attach a light wood board or metal frame to the bike's rear triangle and rack and mount the pole to the board. Or hose clamp or bolt a PVC pipe to the rear rack support and slide the pole into the PVC.

I'll eventually post pix and a report if this comes together.

73 Steve KS1G

2270. bike 'mobile'

Yahoo group: BMHA
Date: 2010-03-08 16:41:41 UTC
From: Barry Bogart
Topic: 2270 Message: 2270

It is interesting that this subject has attracted so much interest. I think I do something different again. I don't operate while cycling as a rule, as I don't feel comfortable with anything that could distract me. But of course a bicycle has the great advantage that it can stop pretty much anywhere, anytime (within a few seconds) without danger. So I do monitor 146.52 while riding, and usually broadcast APRS packets as well. APRS is usually one-sided but I have had the experience of having a real-time APRS QSO on the road when someone noticed me cycling by within range. There is also the little used suggestion of using voice on 144.39 tone 100 simultaniously with APRS, for the benefit of savvy APRS users in range. Of course I stop the bike by the side of the road before I try to type in APRS text. Incidentally it it now even illegal to navigate through GPS (or MP3 player) menus while mobile (car or bike) in VE7-land. But half-duplex comms are still OK.

But what I do differently is not just use my bike to get to operating locations, (either specific mountains or shores during contests, or the the next likely hilltop while on tour). On tour I can monitor the bands with just a short whip, but if I hear some activity I can stop and set up a proper antenna in about a minute. But I don't look for suitable trees to throw up a wire. Instead I use the bike to support a mast - in my case a Buddipole Shockcord Mast. This works because I use a folding bike as a base. I fold the bike 90 degrees and invert the seat post in the seat tube. This make a socket for the mast and the bike provides a triangular (two wheels and seat) base that is stable enough that guying is not necessary. That saves a lot of time. I put the bike/mast on a picnic table or big boulder if available, and that gives me at least 10' of mast. I use regular Buddipole dipole parts at the top, and if I can dispense with the BP loading coils I can extend this up to about another 8 feet with a shock-corded avalanche probe if I think it will help.

You may not need a folding bike to do this. It should be possible to clamp a mast socket somewhere on nearly any recumbent tricycle, or even as regular bike with a trailer at 90 degrees. You just need a wide base that won't fall over. I have tried using a regular bike layed on its side with no success, Anyway I believe in keeping the rubber side down!

Now how did fenders suddenly come up as a hated item?
I LOVE my fenders, both metal and plastic. I maintain fenders on all 3 of my personal bikes: Mountain, Roadie, and Recumbent. They don't keep me completely dry when the street is running water, but they sure prevent the dreaded "Brown Stripe Up the Back"... the only disadvantage I can think of is additonal drag, which doesn't bother me since I'm already loaded with batteries, food, water, and electronics anyway.
I thus disagree. Fenders are great news for cyclists. YMCV (Your Mileage COULD Vary)
What this has to do with ham radio on the bike - I have no idea.
I also limit actual talking on the radio while in motion on the bicycle, because I tend to be busy sucking oxygen and maintaining balance... and reaching for the PTT button is definitely more distracting on the bike than manhandling the CellFone in the car.
I have one bike-mike that has a velcro-stickum PTT switch that I can attach right on the edge of the handle-bar grip, so it only takes a slight waggle from the thumb to operate it without doing anything one-handed. That one currently suffers from a broken connection from a fall several months ago when I foolishly rode the Sandia Ski Trail downhill with one of my sons. I had no visible injuries but the mike cord was severed and I've been making do with a lapel-clip PTT switch since then. When the GOOD handlebar-velcro PTT system was in place I was much more radio-active.
Making even brief QSO's while in motion is still a worthy goal (IMHO) when you can do it safely..... I get a lot more enthusiastic responses when the other end of my QSO realizes I'm truly bicycle-mobile, and a lot more "I think I'D like to try that sometime soon!"
I have little desire to operate HF while in motion on the bike, but one of my most memorable QSO's of yesteryear was back in the late 1980's when 10 was still hot. A new ham friend drove to my house to show me his new Realistic 25 Watt 10 meter rig. He asked me to take the mike and try it, and I called a single "CQ" and was immediately answered by a bicycle-mobile in Boston (We were in Los Alamos NM) who was running the exact same radio, but mounted on his bike with a 108" whip on the back. And he was pedaling around the neighborhood like he knew what he was doing...

Those tires look pretty big at age 56 too. Several years ago I came up to an intersection, there was a guy in a Ford Explorer stopped at the light, I had the green, so I crossed in front of him.... withOUT making eye contact, and withOUT stopping to think that he might turn RIGHT on RED.... an enjoyable privilege if you're driving the cage, but "Death-On-Wheels" to cyclists. I got about parallel with his hood ornament when ZOOM! He roared directly into me and over me. I have this flash-picture of the shock in his eyes as he realized he was running someone down. One of my pedals caught on his undercarriage, and I was dragged, under his front bumper, with his big front wheels rolling ever closer to my head... and I was helpless, just being dragged along the pavement underneath the SUV.
I was dragged out to the middle of the intersection before he got over the shock and his reactions got his foot on the brakes, and we were both shocked that I was able to crawl out from under his car, drag the bike out, and find that I had no broken bones and only mild road rash. One brake bracket on my rear wheel had been crushed, and I had to break it off completely with my pocket pliers to get the wheel so it would spin again. He was a nice guy, and profusely apologetic, even though it was at least my fault as much as his.
I got his address, phone number, and insurance info, and rode back to work shaken but OK. The 1/4 wave spike on my APRS radio had disappeared and I had to eventually replace both wheels due to a visible wobble, but other than that, no damage. I never filed a claim against him, and hopefully he's breathing easier too by now.
Interestingly, my APRS position was reported right up to the impact point. I suppose my wife could have come collected my remains had I not been able to get up and limp back to work.
I was a bit boogered for a while about cycling but decided I had to die sometime and I'd rather get nailed by a car than by a heart attack sitting in front of the TV. So I still ride/commute almost daily, hopefully using a bit more survival sense. Like aircraft pilots, I find that the longer I ride a particular route without incident, the more careless I get, such as trying to beat cars across intersections when I really should stop and let them have the right-of-way. Sure, I can hump through and beat the car, but what happens if my chain jumps or.... whatever? Gotta keep reminding myself that being a few more minutes "late" is better than becoming the "Late" W5AOX....
I hesitate to add to this thread.... every time I tell another cyclist a war story such as this it's frightening to hear all THEIR near misses.
W5AOX

That is pretty much what I just did.

I looked around and I couldn't find any flat aluminum stock that was
1/2" thick. All I could find at the local Home Depot was 1/8" thick.
However... that stuff is kind of "flexible"... a lot of side-to-side moving
to it. So I bought two 1/8" x 1" x 48" pieces of flat aluminum. I cut
each one in half... drilled the holes in the same places... and used
all 4.

To attach the aluminum to the bike rack... I went to Boat US and got
some pieces that are stainless steel. I then used 8-32 stainless steel
screws.

The aluminum "L" bracket that I have was drilled out and a 2" bulkhead
SO-239 was put into it. On the bottom I put an MFJ SO-239-to-BNC
right angle adaptor.I now need to get some coax with BNS's on both
ends (haven't decided on RG-58 or RG-174 yet).

I made the aluminum 24" long... so I can take the bag that slides onto
my rack off and on without the antenna mount being in the way.

Mike,

A good source for metal like you were looking for is a salvage yard, where they crush cars and load rail cars with metal for the foundryu. They usually sell a large varity of new metal you won't find at Home Depot or Lowe's. But bring your wallet.

2282. Adventure Cycling membership vouchers - 7 left

Yahoo group: BMHA
Date: 2010-03-11 14:25:28 UTC
From: Mike
Topic: 2282 Message: 2282

I still have 7 Adventure Cycling membership vouchers left. Since they expire at the end of March, only a few weeks to get your BMHA Newsletter article to me or Norm, N9ZKS.

Any size article is fine. Let me know and I will send your voucher to you ASAP.

Mike, NF0N
BMHA Secretary/Treasurer

2283. VA QSO Party Bike Mobile

Yahoo group: BMHA
Date: 2010-03-22 15:06:00 UTC
From: BrassRat77
Topic: 2283 Message: 2283

I operated this weekend's Virginia QSO Party as a QRP bike mobile (e.g. binding both arms and a leg before entering the fray!). This was my first serious attempt at HF bike mobile in several years. Weather was near-perfect and I had a lot of fun. 51 QSOs after eliminating a dupe. 40M was the workhorse band.

I've added photos of my setup to:
http://groups.yahoo.com/group/BMHA/photos/album/1949487468/pic/list (look for the photos dated March 22 2010)

Bike: Bianchi Castro Valley
Rigs: FT817 (HF, 70cm), VX8 (used for two contacts on 2M)
Antennas:
HF: Modified MP-1: Mirror mount on rear rack, 12" base rod, stock coil, MFJ 12' telescoping rod (alternate mobile 4' whip not used)
[Tried a few QSOs with the MP1 counterpoise wires laid out on the ground. They did not seem to help any so I put them away. Not really in the spirit of "mobile class" anyway.]
VHF: Telescoping whip on FT817 front connector
Mike: Heil Traveler plus stereo earbuds (better audio for me)
Tuner: Elecraft T1 (used on 1st day; just manually tuned the coil second day)
Power: 7AH SLA UPS-style battery

Rig mounting: I have one of the Moutain Ops FT817 mounts from back when they were still in business. The mount is hose-clamped to a Minoura "space grip" handlebar extender. Works pretty well, although it has a tendency to slowly lower as I go over large bumps. The VX8 is in a "universal bicycle mount" from RAAM attached to the stem. I will be using the same mount on this bike and on my road bike for VHF/UHF FM + APRS (with a flagpole j-pole).

I operated as a mobile rather than the expedition class as I thought the 3pt/QSO bonus would make up more than any improvements I could make with a bike-transportable antenna that didn't depend on trees.

For 2011, assuming the weather cooperates again, I may try running more power (outboard amp or my FT857), and try a different whip (maybe the Buddistick shock-cord + capacity hat approach or an inverted-L for some NVIS?) although the MFJ whip works and I should probably leave well enough alone. I may also look into lithium battery options, especially if I am going to use the FT857 - I have no desire to lug multiple SLA batteries.

I operated from two different counties, as I live near the county line and a major bike trail is nearby. (Unfortunately, the trail also has major power lines alongside!) If I get really adventurous for 2011, I may bike to the east end of the trail where it crosses into Alexandria VA, then operate at various locations on the way back. I could operate from 3 counties and 2 or 3 cities this way If I'm willing (and family allows me!) to make a day of it and do about 50-60 miles with the radio gear.

All in all a fun afternoon. I can mount the radio gera fairly quickly, so I need to do this again when I don't feel like going for a long bike ride, especially as we get better conditions on the higher bands.

73, Steve KS1G

I've been saving my emails and duties for another day for a while. I met a young lady I took a shine to as we said when I was young and got married again on February 26th. I am getting back to my inbox and will be getting the newsletter put together very soon. I'll be bringing Kathy with me to Dayton so she can see what kind of people I've been hanging around. Hopefully she will not change her mind about getting a license.

Scott, I am printing the QNC QRP Event notice in our club newsletter. It is very interesting just from the history viewpoint and hopefully you will fill a good sized log on your adventure.

Norm,

That's great news. Congratulations to you and your bride.

I'm not sure when I'll get started on this adventure or how long it will take. Fortunately, I didn't begin last week, with 8" of snow coming Saturday. But I'll have some text and photos to share.

QRP is getting better every day.

2287. Kd8MFR in Michigan

Yahoo group: BMHA
Date: 2010-03-25 22:02:04 UTC
From: brucefreeburger
Topic: 2287 Message: 2287

Hello Everybody,
I'm Kd8MFR/AG Bruce. Years ago I published the BIKESonTV Topica list. Because I am also run a 10k race in the fall, I drop off my cycling each fall.
My cycling club hosts the annual Blue Water Ramble century ride, one of the few international century rides in the USA.
It was working this ride as a SAG driver that a US/CDN VE was my ham partner. This was the first weekend in October 2009. By October 19 I was ready to pass the Technician test, and I bought the radio gear the next weekend at the USECA swap meet in Sterling Hts.
I passed the General exam March 15, 2010. I'm now taking the Extra class with the Hazel Park ARC. This is the cheapest privilege a General license holder is given <Grin>.

I run the Meetup.com group Road Cycling SE Michigan
http://www.meetup.com/Road-Cycling-SE-Michigan/

and the Meetup.com Group Amateur Radio SE Michigan
http://www.meetup.com/Amateur-Radio-SE-Michigan/

Cheers,
Bruce

What range can you get with the APRS link? Our local club (KARS) has an APRS digi-peter, but the person who maintains it tells me it isn't so good for bicycle mobile. Also, since I am interested in cycling about 80 miles to the south, on occasion, i would be "out in the wilderness' with no way of being tracked! Exactly against what I had hoped to accomplish!

In the flat land I can expect about 30 miles with a good half-wave antenna and two watts. If I'm in the Rockies or the Cascades and a digi on some peak 80 miles is not a problem. It depends on the altitude of the digipeter and if my antenna can see it. However, vhf ducting is sometimes a problem.

2291. APRS range

Yahoo group: BMHA
Date: 2010-04-10 15:40:04 UTC
From: Barry Bogart
Topic: 2291 Message: 2291

APRS range is indeed the issue. VHF is line of sight, after all. I have been able to get out over 100 miles simplex from a high point (2000 plus), but only under ideal circumstances. Where I live in the Pacific NSW, there are plenty of mountains to put digis on, but not enough dedicated amateurs to maintain digis at the more remote locations. Once I cycled East over the North Cascades, I could not find any digis at all. I typically stop and send out some packets on every big hill I crest. There is a very active NW APRS gropup, but coverage is mainly in the urban areas around Seattle and Spokane (Vancouver, Portland...).

I have been successful in using sattelites for APRS, but I consider that a fluke. (But of course the fact that you can do sattellite with a D-7 shows you what line of sight can be!). ISS does APRS at times but you have to know where it is. And have a very good antenna.

For event support it may be possible to have roving mobile digis that park on high points along the route, but even that is difficult logistically. I have looked into it for supporting 1200km (750 mile) events in Washington and British Columbia but the fast and slow riders get too spread out to be tracked by any one set of rovers.

BTW is anyone here involved in support for TOSRV? I was wondering if they used APRS. TOSRV is the weekend before Dayton and not far away (Columbus), so I thought I'd give it a shot this year.

WoW!!! Am I so ever to find this site..I am new to Ham Radios (I dont even have my license yet). I hope I can get some help here..

I have joined up with the Texas State Guard and will be getting my license through them..That will be a while..I have to lose ten pounds before I am actually admitted in..However they told me if I wanted to speed up the training, I can look into the ham radio license and get it over with..So I have..And with that, I have opened up a can of worms..I am very interested in this and where I can go with it, in and out of the Guard..So when searching the net, I came across BMHA..I love riding bikes, and I also backpack. With that, I am now interested in how to hook up a ham radio to the bike, and using solar cells as an alternative means for power..But where do I start?? What radio should I start with?? So many to choose from..I been seeing everything from "boxes" to handhelds that look like walkie talkies, (but I know they arnt). What antenna to get/build?? etc etc..Any one out there willing to help a newbie get started??And before you comment, yes, I understand I must get a license first, but I am looking ahead and getting the bike prepared..Any suggestions/comments??

Jason

Welcome, Jason. You'll find a lot of knowledgeable (and nice!) people here.

My setup is one of the simplist -- you can see photos of it in an article I wrote several years ago:

http://www.lafetra.com/skip/aa6wk/Articles/CQ-VHF/April-1998.htm

I'm sure that others will reply -- some with bicycle-mobile setups which are much more sophisticated than mine.

Thanks Skip..Great article..Your discussion on Public servicewas good..That is one of my interest..Being in the Guard, we are required to take FEMA classes and I am now on the 4th class.In the process of taking these, I have grown even more an interest in being of service via my bicycle..Search and Rescue is one of the areas that interest me..So when I was asked to take the license test and began to look for information, an idea came into my head of using the Bicycle-mobil as a SAR vehicle..Your article confirmed what I was thinking..

Now all I have to do is figure out the equipment and get started..Hmmm..Lots of homework..

Thanks...

Jason

Welcome Harry, yes BMHA will have a forum at Dayton again this year. This will be our 20th annual forum at the Hamvention. See the main BMHA website, www.bmha-hams.org for details. In past years we have had informal get togethers at the Hamvention but nothing is planned this year, just the forum on Sunday morning.

Thanks for the inquiry and hope to meet you at the forum,

> > I have joined up with the Texas State Guard and will be getting my license through them..That will be a while..I have to lose ten pounds before I am actually admitted in..However they told me if I wanted to speed up the training, I can look into the ham radio license and get it over with..So I have..And with that, I have opened up a can of worms..I am very interested in this and where I can go with it, in and out of the Guard..So when searching the net, I came across BMHA..I love riding bikes, and I also backpack. With that, I am now interested in how to hook up a ham radio to the bike, and using solar cells as an alternative means for power..But where do I start?? What radio should I start with?? So many to choose from..I been seeing everything from "boxes" to handhelds that look like walkie talkies, (but I know they arnt). What antenna to get/build?? etc etc..Any one out there willing to help a newbie get started??And before you comment, yes, I understand I must get a license first, but I am looking ahead and getting the bike prepared..Any suggestions/comments??

2299. FT 817 ND, FD 857, or the PFR 3

Yahoo group: BMHA
Date: 2010-04-12 16:30:23 UTC
From: Jason
Topic: 2299 Message: 2299

Ok here we go..Being new to this I am almost at a complete loss for radios..I was up all night looking at several and reading reviews of them..My top three to check about is the FT 817ND, FD 857, or the PFR 3, and the KX1 doent look bad either..But then I am a newbie, maybe the key is the antenna, Right??

I like the FD817ND for its size, weight and its combo pack of the power source in the same unit..It looks to have several bands..I was curious about how and if it could be hooked up to solar panel? I diffinetly want to do some DXing along with emergency/public service work (thats for the State Guard), but also to do some logging and just how far I can push the radio while I am out there..The radio will be takin on multi day bike trips and backpacking trips..The solar panels are needed to keep the batteries charged and HOPEFULLY just use the radio connected to the panels..

With the FD 817ND can anyone give me suggestions/advice o the PFR 3 and the KX1?? the 857 is also a prime candidate..

I saw several videos, including a members here, on the PFR 3, what is the range?? Does it have the ability to connect to outside of the US?? And has anyone connected it up to Solar Panels??

Thanks,

Jason

Jason,

You stated you were taking classes through FEMA. You may be required to have ssb capability. You need to find out what the Guard expects of your equipment before you buy a radio. Some of these radios you mentioned are cw only.

Hi Jason,

Its dificult to say but I do not recomend to you the PFR3 or KX1 for new radio, this are only CW transceivers and do not know about your CW but at least for me its not a radio for a new one on the radioamateur world.

The FT-817 its an all band radio all mode so you have an all in one but with low power, some times can be a bit fustrating but its a ideal radio for backpack, you will need a external battery and a 10w solar panel will be ok. I have a 2,2Ah Pb gel battery with 5w solar panel and its ok.

The FT-857 can give you more game more watts but need biger battery and also its big and the weith biger that FT-817.

My personal opinion if you want a radio for backpack and bike its FT-817 5W its enougth output to work the world when conditions are good, if not will do great fun working states, canada....

Thing about the antenna its the most important part, but when I am portable and QRP I like light antennas usually wire antennas easy to carry, you can pu between the trees or keep with you a fishing rood.

In other messatge I write a link for a video of one of my portable operations with a bike and PFR3 you can see a solar panel too, its the smaller one by Powerfilm enought to keep the battery 10 pieces of AA 3000mAH in good conditions.

Welcome to the hobby, Jason!

You have several possibly conflicting requirements. I'm a bit of a beginner to bike-mobile but have an 817, 857 and a K1 (larger predecessor to the KX1). My thoughts:

- The CW rigs (K1, KX1, etc.) are better for portability and power consumption and therefore more suitable for backpacking. I know the K1 and KX1 can include an internal antenna tuner so a simple random wire antenna in a tree and a counterpoise may be all you need. K1 is a bit bulky for backpacking but serviceable. KX1 was designed as a backpacking radio. Both are CW-only and max 5W (or less). Great for in-field, and if-all-else-fails, but not so good if reliable emcomm is the goal.

- FT817 is very bike-portable and OK for man portable (power consumption and weight is about as high as you want to deal with on your back) and gives you VHF/UHF as a bonus. Supports CW, SSB, and digital modes. Add a 30-50W external amplifier (like the hfpacker amp kit) for when conditions require more output and you have a reasonable transportable station for general use and emcomm. I like using my 817 with external power (NiMH packs or 7AH SLA) and install either single-use lithiums or low-discharge NiMH when I want to use internal power. There are also improved internal battery packs and many accessories and upgrades available from 3rd parties. The radio's receiver has some limitations in high interference (contest) conditions, aftermarket filters can help a lot with this.

- FT857 is great if you have a source of DC power or someone else is carrying a big enough battery for you. The 857 can operate at reduced TX power off battery, but still has high receive power consumption. It's a great all-around radio, especially when used with computer rig control for faster access to settings and controls buried in the menu system. A detachable front panel makes it easier to mount on a bike. But you need a much bigger battery vs. an 817 or plan on shorter operating time.

- Not mentioned: A handheld and/or 25-50W mobile VHF/UHF FM rig is a mainstay of local public service and special event communications. Both the 817 and 857 can be used as they support 2M & 70CM FM. If I had to buy just one radio and it was going live on my desk or in my car, I'd go with an 857.

If you are interested in transportable radios, also check out the hfpack group on yahoo - lots of good info on man-portable (and woman, bike, kayak, ...-portable) rigs, antennas, etc. The qrp-l list and archives has a lot of good info on trail-friendly radios and antennas.

Bike mobile content: Some pictures of my road bike set up for supporting a century ride with FM voice & APRS, and my commuter as a recent bike mobile in the VA QSO Party here: http://groups.yahoo.com/group/BMHA/photos/album/1949487468/pic/list

From: Jeff Newton
Topic: 2288 Message: 2304

Nice set up - I was finally able to get pieces of metal for my antenna project last week and took at shot at the different configurations over the weekend and found that, I now have the option of putting the antenna and the mag mount up front on a piece of strong sheet metal that fits perfectly into my map pocket on my handlebar bag or going thru the traditional route of having the antenna mounted on the back of the bike like most configurations have been done, that I've in most of the photos in the files section.

I will post photos later this week.

From: ARRL VA Section <memberlist@...>
Date: Mon, Apr 12, 2010 at 9:25 AM
Subject: Virginia Ham Radio
Cruise-In
To: huntington@...

The first ever
Virginia Ham Radio Cruise-In is planned for May Day 2010
in Charlottesville, Virginia -- a central point in the state with easy
vehicular access. The Albemarle Amateur Radio Club in Central Virginia
will
sponsor the first Virginia Ham Radio Cruise-In on May 1, where
hams
can "Meet & greet, show their rig, see others rigs, share the fun
and camaraderie of a great day with fellow hams and the public."
Records show that Virginia has over 16,000 licensed Amateur Radio
Stations.
Many are familiar with cruise-in events at restaurants, drive-ins,
shopping centers or other venues, where participants drive their cars,
trucks, motorcycles, whatever, to display and compete for awards. The
owners of the vehicles take pride in their efforts to restore, modify
or
otherwise spruce them up and enjoy displaying them as much as the
spectators enjoy seeing them.
Mobile ham radio operators are also
proud of the time, effort and more
than a few dollars that they have
invested in their transportable
Amateur Radio stations -- hence the
Amateur Radio Cruise-In where hams
can showcase their work.
The cruise-in is a way of displaying mobile
radio stations put together
by hams -- most of which are made
available for public service
communications. While mobile
communication systems and particularly
cell phones are being discussed nation-wide as great highway safety
issues, it is important for the public to know how much time, money and

resources hams put into their mobile radio stations primarily to serve the
public when other means of communication fail, as well as the fact
that amateur radio mobile operations have been demonstrated to be no
threat to public safety and have no record of such.
Hams who join the
cruise to Charlottesville can pickup a "Certificate
of Participation" just for showing up -- no mobile rig is required,
however certificates will be awarded to the most innovative mobile rig
present for a car, a truck, an RV, a motorcycle and a bicycle; as well as a
special certificate for the ham traveling the longest distance to
participate.
Put this date on your calendar, plan to participate and
spread the word
so others can come too -- the more, the better. The
special event will
be on May Day, May 1, 2010, Saturday, 10 a.m. till 4 p.m. in Darden
Towe Park on Route 20 in Charlottesville. You can register at:
www.albemarleradio.org

Thanks and we look forward to having you with us!!!

2306. Wind noise

Yahoo group: BMHA
Date: 2010-04-15 19:53:29 UTC
From: Kent Thygerson
Topic: 2306 Message: 2306

New to the Bike Mobile. I have been working on antennas for a couple months. After seeing that the rubber duck is useless, I ended up with a 1/2 wave from Jetstream. After the rain has cleared, I took the bike out for the commute and finally made contact.

The only compliant on my transmission is the background noise, wind, cars, trains. What is the best way to reduce the background and wind noise.

I am currently using a Yeasu Vx8 with the speaker Microphone.

Would a headset cut the background noise? What have other BM hams done to reduce the wind noise?

Thanks

Kent

I have used a Yaesu VX-5 for some time and also their noise-canceling speaker / mic. If you can get w wind screen as used by performers and / or on-scene newscasters, it can be of great help. You will be in the wind most of the time, except if you are riding with the wind and at the approximate same speed. In addition, you will be generating your own wind as you pedal and talk!

I put my VX-5 in a pocket of my handle-bar bag and then only have to hold the mic.

If you can get / make a J-Pole rather than the half-wave whip, you should see a marked improvement. You can make one with some 300 Ohm twin-lean or window-lead and just fasten it to a fiber glass flag pole. The website has lots of antenna ideas and designs.

From: PSK 3-13-2010pp
Topic: 2306 Message: 2308

I use the VX8 bike mobile as well and thought the Blue Tooth accessory would really be good. It is good for RX, is overcomes the ambient wind and extraneous noise quite well. The TX side, not so good. The VOX is pretty worthless with wind noise. The PTT on the headset works fine, you just have to keep driving one-handed.

BTW I use a homebrew twin-lead j-pole on a fiberglass stick as someone has already suggested and I hit repeaters up to 30 miles away.

Have fun-BMH is great.

I too love fiberglass bike-flag J poles for bicycle mobile:
http://qsl.net/w5aox/images/APRS/JpoleBike2.jpg
http://qsl.net/w5aox/images/JPole_W5AOX_Bike.jpg

I have tried several bike-mobile mic setups, and all suffer when the wind blows strongly across the microphone:

-Kenwood remote speaker-mike (Works OK but have to ride one-armed when using it or pull over and stop)

-MFJ earpiece/boom mike (Works well, not too sturdy, have had to put it back together a few times)

-Puxing - style Chinese "secret service" mike with collar-lapel clip microphone and coiled audio tube piping sound into the ear (Works OK, but again, one-handed riding cuz you have to reach for the PTT/mic button)

-MFJ "Ear-Mike" setup with Velcro mounted PTT button for handlebars
(This item apparently has been discontinued since it worked so poorly. It was almost worth the price as a donor source for the velcro PTT switch which is great on ANOTHER mic)

I have trouble resisting ads for "another" earpiece/mic setup. I just bought another online (Again from a Chinese Ebay vendor) that is intended for motorcycle use. I'm hoping it works well....

> I have tried several bike-mobile mic setups, and all suffer when the wind blows strongly across the microphone:

Search the list archives for "pryme" for several threads from last year and 2008 discussing their boom mike/earpiece sets. I used one with a VX5 with some success but ultimately decided the 400-series model wasn't rugged enough. Their motorcycle version has been suggested as better (more rugged) and has a waterproof PTT button for the handlebars.

I replaced the Pryme with a McKay C1LHS and used it on another century ride last September. I mostly listened, so can't say how good it is at wind blocking. I described the setup in post 2097 on 8/26/2009. I have subsequently picked up a VX8 and while the bluetooth feature works well with several 3rd party headsets I've tried, I have yet to try it bike mobile and would prefer a separate PTT button (like the McKay bluetooth headsets) that can be attached to the handlebars so I am not riding 1-handed.

Bike-flag j-poles or coaxial dipoles are my favorite bike antennas - about as lightweight and good-performing for 2M as you are going to find, and the bike flag provides some safety benefits and I can use it on a road bike without a rack.

Klien Electronics has several options that work on bikes... What I got is their modular series with an in ear pickup that is no longer listed on their website.. BUT they still show the throat mic (remember all the old WW-II movies showing the pilot keying the mic on his throat) which would reduce noise to virtually nil.

The only problem with the throat mic is they give you a sore throat!
There is an irritation from talking with the mic riding on your voice
box. You would need also to replace the mic elements. The originals used
carbon buttons. For the nostalgia kick, wear it with the WW-II pilot
helmet (actually, little more than a fabric head-cover). Don't forget
the goggles! Fair Radio may even have some of each!

I've seen the new throat mic set up from Klien and I don't think it would be that bad. The ear-piece pickup that I got uses the vibration of the bones in your ear to transmit and it is the quietest mic I have ever had.. They may still have it but just don't list it.

I use the Icom HS headset bike mobile/motorcycle mobile on my 2 meter right with the rubber wind screen in place have never had complaints of back ground or wind noise. Others in my group use the Heil headsets with rubber wind screens and report having good results.
Good Luck

Thanks for all the leads, it sounds like this is a common issue. Sounds like it has been rehashed several times.

As for the antenna, I tried about 7 different 300 ohm lead line antennas. The SWR was too high on all of the templates I used. I even tried a lot of experimenting. Out of desperation and a desire to just get on the road, I opted for a manufactured antenna. It seems to be working fine for my needs.

Kent,

Sometimes the J-pole antennas made from 300 Ohm twin lead generate a high swr. One way to control the swr is to leave enough coax to allow a decoupling coil - four turns making a four inch coil right at the base of whatever you're using for an antenna mast.

2317. SOLAR POWERED WITHOUT BATTERIES

Yahoo group: BMHA
Date: 2010-04-22 16:40:31 UTC
From: David
Topic: 2317 Message: 2317

At 11:30 GMT today: (22nd April 2010)

I had a 2 way QSO with John, ZL2JBR on 20M SSB over in Wellington New Zealand, whilst using only solar power from my pedestrian mobile 2 wheel trolley
(without the use of any batteries) with a 5/3 report.

The QSO was witnessed by Lee, G0DBE.

The radio on the trolley was a Mizuho MX-14S 20M 2 Watt SSB/CW handheld transceiver
powered by a double solar panel mounted on a 2 wheel trolley, and the antenna was a full size quarter wave again mounted on the trolley, the ground was a home made tuned frame GTU without radials.

I operated from Lytham Lancashire, North-West England and I was very close to the sea water.

It sure makes a change for the sun to shine over here!!

From: AOX
Topic: 2288 Message: 2319

If you use the http://aprs.fi/?call=w9az-14 aprs tracking lookup, you will find most digipeaters now have a "Normal receiver range estimate" under the "Info" link for that callsign. Comes in very handy. I just looked up W9AZ-14 as a near digi to your QTH. Substitute the call of another digi if you know it, or link to aprs.fi and enter your desired area and watch the local activity for a while and see what kind of coverage you might expect.... by watching what's already going on there.
How does your maintenance person know "it isn't so good for bicycle mobiles"? Has he tried it, and with what equipment, power, and antenna? I notice larger "dead spots" when using my TH-D7 with my J pole on the bike compared to my 40+ watt mobile TM-D700 in the car but I still find it useful to track my movements. If you ride far enough eventually you'll get in range of another digipeater.
If there is an undesirably large "Dead Area" with no APRS digi coverage that you like to frolic in often, get involved with a club or another ham or two and see if you can't get another digi installed there. Setting up a digipeater is a fair bit less expensive than a voice repeater, and (judging from the number of voice repeaters with no voices on them answering me when I come through your area), more useful.
If you have a Kenwood TM-D700, 710, or Yaesu FTM-350 in your car, leave the radio on and activate the digipeater function in it just before you ride off on the bike. It might add another few miles to your bike aprs coverage.

2320. Dayton Hamvention BMHA Forum 2010 Details

Yahoo group: BMHA
Date: 2010-04-25 14:09:09 UTC
From: Mike
Topic: 2320 Message: 2320

Dayton Hamvention 2010 BMHA Forum
Date: May 16, 2010
Time: 9:30
Room: Room 5

The 20th annual BMHA forum is set for Sunday, May 16th at 9:15 am in Room 5. Mike Nickolaus, NF0N, is our forum moderator this year.
Our featured speaker is Barry Bogart, VE7VIE/WV2J. Barry is an experienced tourist and will be on tour while attending the Hamvention. Barry is riding his folding bike and will be demonstrating his setup complete with APRS.
We are encouraging anyone to bring their setup and display at the Forum. We will set aside a portion of the forum time for attendees to roam the room and ask questions, take pictures and learn about how others have setup their bikes with VHF/HF gear and antenna systems. If anyone would like to present pictures or audio, we will have the necessary viewing equipment available. Bring your CD/DVD or presentations on removable media. Computer equipment will be supplied.
There will be a short BMHA business meeting and Q and A if time permits.
Arnie, KA0NCR, the BMHA ride coordinator, will review the annual Hamvention Bike ride from Saturday. We are hoping for good cycling weather and to meet many of you on the ride.

See the BMHA web site at:

www.BMHA-Hams.org

or BMHA on Yahoo Groups for any last minute forum changes or additions.

The Dayton Hamvention website is located at:
http://www.hamvention.org.
Mike Nickolaus, NF0N
BMHA Forum Moderator

From: David
Topic: 2321 Message: 2321

Hello All,

I will be out today (Tuesday 27th April) from about 1700 gmt for a couple of hours on 20M SSB around 14.200 plus or minus QRM.

I will be bicycle mobile running QRO (about 200Watts) from the promenade in Blackpool Lancashire.

From this location I have excellent take off into USA and Canada.

Hope to meet some of you on the air ...

Topic: 2321 Message: 2322

Hello All,

I was out from 1700Z until 2030Z cycling down the promenade near to the sea in Blackpool in northwest England using the bike plus the QRO trailer.

The only reason I went home was it went dark!

Operating only 20M, the propagation into USA, Canada, South America South Africa and Middle East was really excellent!

Worked around 150 DX stations in the 2 and a half hours, so well worth while!

Didn't hear or work any other bicycle mobilers but several car mobile stations with some west coast Canada and USA mobile stations worked from my bike.

I will be out Thursday evening for an hour or so operating 20M SSB high power pedestrian mobile from Lytham (nr Blackpool) on the northwest coast of England.

73's all ...

The server has a limited number of connections (which usually isn't a problem). If too many people access at the same time, you may have to wait a bit and retry.

2327. Mounting an HT on a bike...

Yahoo group: BMHA
Date: 2010-05-03 13:02:03 UTC
From: n1evh
Topic: 2327 Message: 2327

What are people using to mount theit HT's to their bikes???

A friend of mine asked me about mounting an HT to their mountain bike. I told them that I used an "old" Radio Shack FRS Handlebar case... but this hasn't been availabe for many years.

I told them that I've heard of people using a RAM mount (since RAM makes a mount that will go onto a bike handlebar)... but I don't know what they are using for a cradle for the radio.

To me... it would seem as if you need to use a cradle in which you need to "squeeze" on the sides to close onto the side of the radio. Now... I would think that this would pose a problem with the PTT or the DC jack on the sides of radios 9which would be more of a problem with how small some of the HTs are these days).

I've seen pics of HTs mounted on bike handlebars... but you really can' really see any detail as to how the mount it attached to the bike and how the radio is attached to the mount.

If you are using a RAM mount... what model cradle are you using with your HT and do you have problems with it interfereing with the PTT or DC jack on the sides of the radio??

Thanks,

Mike - N1EVH

2328. RE: [BMHA] Mounting an HT on a bike...

Topic: 2327 Message: 2328

My mount is entirely home-brew. I used a piece of square-cross-section plastic downspout (about 4 inches square), cut in half to make two "U"-shaped sections that I mounted back-to-back.

A cutout in the side allows the PTT and power connections, and a Velcro strap holds the radio in place. A piece of "wetsuit" foam provides a small amount of padding.

The mount is attached to the handlebars and is adjacent to the stem (which provides fore/aft lateral stability). I used shoelaces (literally) as straps to tie the mount in place (the Velcro then holds the radio to the mount).

Pictures of my setup are in an article I wrote a few years ago:
http://lafetra.com/skip/aa6wk/Articles/CQ-VHF/April-1998.htm

I use RAM mounts for both my Kenwood TH-D7 and my Magellan Gold GPS, which are mounted themselves on homebrew aluminum bracket mounts.
RAM's made for specific radios are ingenious in providing secure mounting in ADDITION to complete access to all ports for external microphones, GPS connections, etc.

http://www.ram-mount.com/CatalogResults/PartDetails/tabid/63/partid/0820650770450720790760
45075069049085/Default.aspx

http://www.ram-mount.com/CatalogResults/PartDetails/tabid/63/partid/0820650770450720790760
45077065050/Default.aspx RAM mount for Magellan Meridian series

On my RAM mount, there are clever cutouts that allow the radio to be inserted with the large capacity battery, belt clip, GPS and external speaker / microphone connection, etc.
Most radios have belt clips and most GPS units have some sort of clips or lips for dash mounting which can be adapted for your needs.
I've used steel coat hanger wire, bent to the desired clip shape to snap my GPS into, as well as sheet aluminum stock cut into desired bracket shapes. I also have used various camera and electronics "packs" and carriers, with the related strap hooked around the handlebars or seat-post, to carry desired radios and electronics.
I just barely, this weekend, ordered a "PowerPort" shoulder harness which is a bit on the pricey side (46 bucks including shipping) but appears to be pretty well ideal for hiking or cycling with all sorts of antenna and radio / gps mounting possibilities:
http://www.powerportstore.com/radio%20harnes%20AR.htm PowerPort shoulder harness

Mike - I've used 2 approaches. For my VX5, I attach a neoprene "Kangaroo Pouch" to a Minoura handlebar extender (the case has a short belt strap in the back that works fine for this). The radio has a tendency to rotate around if mounted on the handlebars. Provide strain relief for the antenna cable and use the wrist strap or some other attachment point to provide a secondary breakaway strap! No rain protection (unless I use a ziplok baggie) so this is a fair-weather install. I've used it with a lightweight boom-mike headset (PTT button velcroed to handlebars) or earphone (1 ear!) and speaker mike. See other posts from me for comments on boom mikes. I don't try operating in-motion with the speaker mike.

When I got a VX8, I also purchased a RAAM "Universal Radio mount" that I zip-tied to the stem (I wanted the handlebars free for other things). Costs more money but so does the radio so I at least think it's worth the cost! RAAM makes a motorcycle-style mount (uses hose clamps I think to attach the mount to the "bike") if you want something more rugged (although bigger, heavier, and uglier). The radio's belt clip attaches firmly to the mount; although I still have a breakaway strap just in case. The VX8 is water-resistant, so I can use this in rainy conditions. Have only used it with the speaker mike, experiments with a bluetooth headset are planned.

Either set up has worked extremely well. I've used the VX5 on multiple century rides and the radio has stayed reliably in place on a variety of roads including chip-seal, gravel, and descents (smooth pavement!) at 40+ mph. I don't have as much experience yet with the VX8 but the RAAM mount is solid - I gauge a mechanical failure as extremely unlikely.

If you use a whip antenna with these radios, I suggest as lightweight a model as possible - there is a lot of vibration when moving and I think it could damage the SMA mount over time. The VX8 seems better built than the VX5 in this regard.

I have posted pictures of my VX5 and VX8 setups in the photo section - look for KS1G or use these links:

VX5 (on road bike): http://groups.yahoo.com/group/BMHA/photos/album/1949487468/pic/1667390347/view?picmode=&mode=tn&order=ordinal&start=1&count=20&dir=asc

VX8 and FT817: http://groups.yahoo.com/group/BMHA/photos/album/1949487468/pic/1105146813/view?picmode=&mode=tn&order=ordinal&start=1&count=20&dir=asc

After clicking on the link and seen the TH-D7 cradle... I did a search on the
RAM website for Kenwood, Alinco, Yaesu, and Icom. It appears the TH-D7 cradle is the ONLY cradle that is made for a specific ham radio HT. It would be nice if they made cradles for other HTs.

I have the single u-bolt handlebar mount with I believe the 3-inch extension arm and the cradle for my Garmin GPS V. I find it to be a very solid mount for
the GPS, so I didn't know if something like this would be readily available for
HTs.

I use RAM mounts for both my Kenwood TH-D7 and my Magellan Gold GPS, which are mounted themselves on homebrew aluminum bracket mounts.
RAM's made for specific radios are ingenious in providing secure mounting in ADDITION to complete access to all ports for external microphones, GPS connections, etc.

http://www.ram-mount
com/CatalogResults/PartDetails/tabid/63/partid/08206507704507207907604507506949085/Default.aspx

http://www.ram-mount
com/CatalogResults/PartDetails/tabid/63/partid/08206507704507207907604507706550/Default.aspx RAM mount for Magellan Meridian series

On my RAM mount, there are clever cutouts that allow the radio to be inserted with the large capacity battery, belt clip, GPS and external speaker / microphone connection, etc.
Most radios have belt clips and most GPS units have some sort of clips or lips for dash mounting which can be adapted for your needs.
I've used steel coat hanger wire, bent to the desired clip shape to snap my GPS into, as well as sheet aluminum stock cut into desired bracket shapes.
I also have used various camera and electronics "packs" and carriers, with the related strap hooked around the handlebars or seat-post, to carry desired radios and electronics.
I just barely, this weekend, ordered a "PowerPort" shoulder harness which is

a bit on the pricey side (46 bucks including shipping) but appears to be pretty well ideal for hiking or cycling with all sorts of antenna and radio / gps mounting possibilities:
http://www.powerportstore.com/radio%20harnes%20AR.htm PowerPort shoulder harness

I also have the "Kangaroo Pouch" that I've used in the past with my VX-5R (which is no longer with me). The same pouch also seems to fit the VX-7R and the Kenwood TH-F6A. I never really thought about trying to use it as a bike mount. I guess some black UV ty-wraps could be used to attach the belt-clip on the back of the pouch to the stem... but not sure if it would rotate side-to-side on there. I guess I could take off the Radio Shack FRS Radio handlebar case that I have and ty-wrap the pouch to the stem and see how it is. Can also see how kind of shock/vibration the radio would take being in that case mounted on there stem.

I seen that "Universal Radio Mount"... but to me it looked as if the fingers on
the side would've been spaced kind of far for the smaller HTs on the market. Seeing you using it with the VX-8R will make me reconsider that option.

I liked how you have the FT-817 setup on the bike... but you state that you re
using a mount that is no longer made for the radio. I've been playing around with the idea of mounting my FT-817 on my bike. was looking at this RAM mount...

http://www.gpscity
com/ram-mount-plastic-universal-small-side-clamping-cradle.html

and was thinking about using two of them with the handlebar mounts (with short extension arms) and rotating them so they would be sideways so they would clamp onto the top and bottom of the radio on each side. The mic would be the only problem. Seen something in the FT-817 group years ago where someone took a computer headset/boom mic and made up a little box with switches for PTT and the up/down buttons that I guess I could make up for use on a bike.

Subject: [BMHA] Re: Mounting an HT on a bike...

Mike - I've used 2 approaches. For my VX5, I attach a neoprene "Kangaroo Pouch" to a Minoura handlebar extender (the case has a short belt strap in the back that works fine for this). The radio has a tendency to rotate around if mounted on the handlebars. Provide strain relief for the antenna cable and use the wrist strap or some other attachment point to provide a secondary breakaway strap! No rain protection (unless I use a ziplok

baggie) so this is a fair-weather install. I've used it with a lightweight boom-mike headset (PTT button velcroed to handlebars) or earphone (1 ear!) and speaker mike. See other posts from me for comments on boom mikes. I don't try operating in-motion with the speaker mike.

When I got a VX8, I also purchased a RAAM "Universal Radio mount" that I zip-tied to the stem (I wanted the handlebars free for other things). Costs more money but so does the radio so I at least think it's worth the cost! RAAM makes a motorcycle-style mount (uses hose clamps I think to attach the mount to the "bike") if you want something more rugged (although bigger, heavier, and uglier). The radio's belt clip attaches firmly to the mount; although I still have a breakaway strap just in case. The VX8 is water-resistant, so I can use this in rainy conditions. Have only used it with the speaker mike, experiments with a bluetooth headset are planned.

Either set up has worked extremely well. I've used the VX5 on multiple century rides and the radio has stayed reliably in place on a variety of roads including chip-seal, gravel, and descents (smooth pavement!) at 40+ mph. I don't have as much experience yet with the VX8 but the RAAM mount is solid - I gauge a mechanical failure as extremely unlikely.

If you use a whip antenna with these radios, I suggest as lightweight a model as possible - there is a lot of vibration when moving and I think it could damage the SMA mount over time. The VX8 seems better built than the VX5 in this regard.

I have posted pictures of my VX5 and VX8 setups in the photo section - look for KS1G or use these links:

VX5 (on road bike): http://groups.yahoo com/group/BMHA/photos/album/1949487468/pic/1667390347/view?picmode=&mode=tn&o der=ordinal&start=1&count=20&dir=asc

Glad you like the FT817 mount. I think you could home-brew a clamp using 2 pieces of plywood and a couple of long bolts to clamp them together with the radio held firmly in between. If you have suitable aluminum or steel bar or u-stock and tools to cut & drill it, you could probably make a metal clamp.

The Minoura handlebar extender with the 817 mounted on it has a tendency to slowly rotate down from vibration - not a big deal, you just need to be aware of it. A RAM mount with U-clamp is probably stronger, I'd be careful using it on carbon-fiber handlebars (crushing).

I hesitate to mount an HT *on* the bike ... *especially* "off road".

Many (most?) HT's are not built for that kind of abuse, and, IMHO, you are only looking for trouble down the line. Riding on the road is only marginally better. Some streets are quite bumpy.

Hello,

I've dusted off my bikes after years of storage. I'm back at it and just finished a ride with a local B-pace group. Good stuff! Anyway, I'm not sure I agree with this assessment. I mounted an old HT to a road bike and did that for a little while. I cracked a rim and pitted a headset... radios were fine. Then I mounted to two different mountain bikes with great success. If anything, the front suspension actually takes some of the edge off the bumps. Yes, that includes off-road... and I mean in an areas (Cape Cod at the time) with LOTS of rocks. I didn't take the time to go around... I rode right over them. The bike's been crashed a few times, too. The HT has held up fine, thanks to no direct impacts. Keep in mind the radio is a 1995 Yaesu FT-11R, no MILSPEC standards on that thing! Today's tougher HTs are up to the challenge.

Regarding my choice of mounting, I opted to use the mounting system for an old (and inexpensive) headlight mount. The details are a bit hazy. But take any inexpensive headlight, perhaps an old one that you've upgraded from, and remove the mounting parts. I glued/screwed the part that came off the light onto a small Radio Shack project box and cutout pieces for the wires to pass. The part that goes on the handlebars goes, well, on the handlebars. ;) The result is a quick-release HT mount. A velcro strap ensures the HT doesn't come out, even in endover-type crashes. I didn't use any retension straps. I figured my RF cable was sufficient for keeping the HT from hitting the ground if it somehow came off. I have OLD photos on my website at http://www.KE4WMF.com. Keep in mind these are before affordable digital cameras and before I was as detail-oriented as I was when I documented my car's ham shack.

I'm currently between bicycle mobile rigs. My FT-11R is semi-permanently mounted in my car as an APRS radio. But I have my eyes on the new VX-8GR for bicycle duty. I'll be sure to post plenty of details when I get that one set up... possibly in JUL. :)

BTW, I'm not quite the crashmaster this post portrays me to be. Most of my incidents happened at low speed, but on really challenging trails. I'll attempt any obstacle that doesn't require airtime. But I've always reserved the right to bail out rather than wind up breaking more bones. ;)

73,

Scott

Well... I've had an HT mounted on my various mountain bikes for about 10 or so years... using my old Radio Shack FRS Radio handlebar case. Over the years I've used my Alinco DJ-560, my Yaesu FT-51R, FT-50R, VX-5R, and VX-7R, and I've used my Kenwood TH-F6A and TH-D7A. Al radios are still in perfect working order... except for the VX-5R. After 10 years... the radio was very difficult to turn on (I could press it 20 times before the radio would turn on). With my vision these days... I didn't feel like ordering a new keypad from Yaesu and try to replace it.

The only problem I've had with any "bumps"... is one time my VX-5R came out of the handlebar case and it crashed to the ground. It kind of landed on the antenna and SMA. The antenna got bent a little... the SMA got bent a little... but everything still worked fine.

Ever since then... I've used a spring-loaded clip on the radios lanyard and I wrapped it around the handlebar once and then clipped it on either the break or shifter cable... and no radio has crashed to the ground since.

2339. Re: Mounting an HT on a bike...

Yahoo group: BMHA
Date: 2010-05-04 16:29:42 UTC
From: AOX
Topic: 2327 Message: 2339

I've been running mounted HT's on bikes since I was in college in the 1970's and continuously on workdays (I bicycle-commute) for the last 5 years.
I've used Icom 2AT's, W2A's, homebrew HT's in aluminum mini-boxes, Yaesu VX-8R, and most continuously for the last 3 years, the Kenwood TH-D7. None of them has ever hit the ground (I popped a W2A off my belt onto the pavement while RUNNING to catch a city bus a couple years ago - Battery separated and required repair; radio was fine). The worst hazards I've encountered have been Microphones popping off their hook/mount and catching in the front wheel spokes. This has happened 2 or 3 times: The mic and cord survived, as did I, each time. Shortening the stretchable length of the mike cord by tying it off with Velcro or zip ties cures this. Spending the time to set up a motorcycle-style PTT switch on the handlebars and helmet-mount ear speaker and windsock-equipped microphone also cures this.
I have LOST spare NiCad batteries, accessories, and a remote speaker/microphone from bouncing out of the backpack on bike rides, as well as jackets and other items. This is just a hazard of riding a bike carrying anything useful.
Even when radios were more relatively expensive, I have always wanted to use them in all my activities. I think the enjoyment of using them - ESPECIALLY on the bike - is worth the risk of having to repair or replace them, which in my experience doesn't amount to much. Nowadays, with radios SO relatively inexpensive (fraction of the cost of most bikes), why get uptight about risking them by using them on your most-fun conveyance?
The biggest maintenance item in my biking efforts is wear and tear on the antenna, requiring repair or replacement once or twice a year. I consider this a small price to pay for the enjoyment of ham radio and other geek gadgets on the bicycle.
I currently use a foam shock-mount consisting of a sandwich of 2 "floating" aluminum pieces with foam packing material in the middle.
I find that mounting the radio on a quasi-flexible mount, allowing flex in the mounting system while bouncing, helps a lot. Prior to this, I put thousands of miles on the TH-D7 using only a cut piece of aluminum 1/8" X 2.5" X 10" strap, hose-clamped to the handlebar stem on one end and the D7 clipped on the other end with its belt clip. Adding stick-on velcro loop pads to the smooth aluminum end helped the D7 clip maintain grip.
As noted by others, there are many ways to skin this cat. Have fun and run what you brung, and tell us about it.

Topic: 2341 Message: 2341

Hello!
I am a little late getting this out, but I would like to remind everyone on the BMHAE-group that the Dayton Hamvention is coming up next week, and that we are planning on having another BMHA Saturday afternoon bike ride.
I would like to invite any BMHA member who is at the Hamvention to come outand take part in the ride. It is on a very enjoyable bike trail, ride as much or as littleas you like. Afterward, there is a nice place to eat across the road from the trail headwhere we enjoyed a nice buffet last year.
Details of the ride are on the BMHA web site, and if you have any questions please drop mean E-mail at KA0NCR at Yahoo.com , with the usual "at" replaced with "@" to help keep spambots at bay!

A 19 inch or 80 inch antenna... now one thing that I've seen EVERYONE say is that you should go with a 1/2-wave antenna so that you don't need a groundplane. Not sure what kind of groundplane a bike offers.... but the 19 inch antenna would need it and I guess the 80 inch antenna is about a full-wave.

I was thinking about using my Diamond CR627 (6m/2m/70cm) tri-band antenna which is about 62 inches long and only using it 2m (3 - 1/4-wave) and 70cm (3 - 5/8-wave)... but ended up getting a dual-band antenna which was advertised as a "no ground required" a 1/2-wave on 2m and 2 - 5/8-wave on 70cm.

TIMEX..OOPS!! it was the timex commercial that takes a licking and keeps on ticking. Usually heard in my part of the country during the Friday night fights.

Antenna. the 80 inch antenna is the Hustler Collinear. It is used primarily to keep the buses out of the bike lane. The buses have a habit of putting their outside mirror only inches from my helmet. When I swing the antenna they move over one lane and give me room. It of couse puts out a good signal.

The 19 inch antenna is of course not the best choice in the world if you are comparing 1/4 wave to 1/2 wave antennas. It is used because, IT WAS LYING AROUND DOING NOTHING!!! hi hi Surprisingly it does a great job here on the repeaters during special events where the big antenna isn't needed for self defense. Most of the repeaters in this area are either on the roof of the hotels or mountain tops.

2350. Re: Dayton Saturday ride

Yahoo group: BMHA
Date: 2010-05-15 13:28:10 UTC
From: Skip
Topic: 2349 Message: 2350

LAST YEAR'S BIKE RIDE INFORMATION IS AT:

http://bmha-hams.org/BMHA/Timely/BMHA%20Ride%202009.doc

SELECTED INFO:
For more info, check out the trail website at:

http://www.miamivalleytrails.org/wolf.htm

I felt that the best time would be Saturday afternoon with a start time of 4 PM local time. This should give people a fair amount of time all day Friday and Saturday morning and part of the afternoon to check out the Hamvention, while still giving time to get to the trail head.

The trail should provide about 25+ miles of travel for those of you who wish to ride to each end.
We plan to start at the trail head at the intersection of Arlington Rd and Upper Lewisburg Salem Rd, which is just off I-70 exit 21 at Brookville. This trail head has parking, and several places to eat near by. It is just across the street from Rob's Restaurant and from what I am told it is great and that it is frequented by the local bike club on their Saturday morning rides.. so that sounds like a great endorsement to me! We can plan to chow down at Rob's after the ride.

The easiest way to get to the trail head from the Hamvention is to go west a few blocks from the Arena to Salem Ave. and then head north to I-70. Proceed west on I-70 to Exit - 21. Take the off ramp, go south over the Interstate and proceed 1 block south to the trail head at Golden Gate park. The trail head will be on the east side of the road just before you cross the Upper Lewisburg/Salem road way.

2351. KJ6CQC Bicycle Mobile Trans-America

Yahoo group: BMHA
Date: 2010-05-15 14:59:46 UTC
From: Dean McCollom
Topic: 2351 Message: 2351

Greetings,

My name is Dean McCollom KJ6CQC and I am active with the Santa Cruz County California ARES group.

I will be operating bicycle mobile on a trip from Florence Oregon to Yorktown Virginia. Il try to make as many QSO?s with the locals as I can on the local 2m and 70cm repeaters. Additionally, I will be monitoring 146.520MHz. so Keep your eyes and ears open for me. I would be interested in hearing about and participating in any local two meter nets. If things work out I would be willing to talk about my adventures at club meetings. (Consistent with the logistics of being bicycle mobile)

Please pass the word about me along.

To learn more about my route please see:

http://www.adventurecycling.org/routes/transamerica.cfm

To learn more about me please see my trip journal at:

http://www.crazyguyonabike.com/doc/LemonadeMagnate

I hope to hear you on the air.

2354. Dayton Hamvention BMHA Forum Report

Yahoo group: BMHA
Date: 2010-05-22 03:17:22 UTC
From: Mike
Topic: 2354 Message: 2354

Dayton BMHA 2010 Forum ☐ Another Great Turnout

This year's forum was another great one. We had a great turnout, nearly 100 and had a great program speaker.

Arn Grubbs, KA0NCR, the organizer of the Dayton BMHA ride, talked about the 2010 ride and then showed pictures from this years ride. The weather was great and our turnout doubled from last year. He did a great job of making it another successful ride and the consensus was to do it again next year. See the Photo section in Yahoo Groups for the pictures.

Norm Huber, N9ZKS, our newsletter editor talked about the newsletter and his plans. He also asked for more articles as this is one of the best ways to show what you are doing and to distribute information to the BMHA membership.

Our featured speaker, Barry Bogart, VE7VIE/WV2J, and Barry always has some great experiences to share. Barry is on tour in the east coast and brought his folding bike to the forum and demonstrated how he has APRS mounted on it along with a special mount for an antenna that uses the bike as a base mount. See the pictures section for this picture. He talked about some of his many experiences touring both on the west coast of Canada and other expeditions he has made in various parts of the world. He had some great pictures. We wish him the best on his current tour.

We always ask and promote others to bring their bike or project and speak at the forum. Bob Curry, KC3VO, brought his special hybrid bicycle with him to the forum and we were able to let him speak and demonstrate his special bike. It is a combination electric/pedal bike and has some very special ways of running. You can pedal or use the batteries inside the wheels to drive it. Braking can assist in recharging the batteries similar to a hybrid car. Bob also has a 300 watt radio using a backpack amplifier he can use while he rides.

I was able to take a number of pictures of the forum and the bicycles displayed this year. Unfortunately my camera didn't work very good as many of the pictures are fuzzy. I also uploaded the pictures Arn, KA0NCR, snapped at the BMHA bike ride. See the Photo section of Yahoo Groups for the pictures.

Another great forum and I look forward to hosting it once again next year. I fully expect the Hamvention to invite us once again.

Mike, NF0N

Jim,

Your posting prompted me to finish my article and post the pictures. I have just uploaded a few pictures and a short report on this years forum. Unfortunately my camera didn't work very well for some reason so the forum pictures are quite blurry and out of focus. I need to look at a new camera I guess. But at least you can see the bikes and owners of same.

2357. Bike ride to my 50th Class Reunion

Yahoo group: BMHA
Date: 2010-06-01 00:32:43 UTC
From: Mike
Topic: 2357 Message: 2357

A little over 20 years ago Hartley Alley, NA0A, the founder of BMHA rode his bicycle from his home to his High School he graduated from 50 years earlier. From that event, BMHA was founded and continues even today.

As time progresses, next Saturday is my 50th High School Class Reunion and I plan to do exactly what Hartley did. I am very lucky in that my High School is only 180 miles from my home and Hartley's was over 1200 miles. Even though it's on a much smaller scale, I do plan to ride from South Sioux City, Nebraska to Hampton, Nebraska taking three days to ride the route. I am going minimal, staying in motel's and foregoing rain gear, taking very little. I do plan to take my duo-band HT and hope to talk to a few of the locals on the repeaters on my way down to Hampton.

If you do twit, I plan to use the Blackberry to twit as I ride and note my location from time to time. My Twitter ID is nf0nmike if you want to follow.

Not as big of a scale as Hartley but it does carry on the tradition of riding to your 50th reunion. Maybe this will inspire others to do the same and publish your travels. Let's keep it going.

Mike, NF0N

2359. Cycling around Dayton

Yahoo group: BMHA
Date: 2010-06-02 15:35:52 UTC
From: Barry Bogart
Topic: 2359 Message: 2359

That's a great plan Mike. Unfortunately my 50th in two years is in New Jersey and I don't think I'll be riding there. (BTW will the fellow from Glen Gardner, NJ, class of 66, who was at the Dayton Forum please contact me).

The week after Dayton I rode to Erie, PA, about 1200 kms (750 miles). It rained the first two days and I had flat-tire trouble in Springfield but the two bike shops there (Bike Stop and Springfield Cyclery) were VERY helpful. Thanks to my car GPS I could find them! I had a blowout in the heat in Medina (I think). But the folding bike performed like a champ.

One of the bike stores pointed out the bike trail to Urbana which was a nice change. Ohio is full of bike trails, but they can be hard to find (GPS coords would have been nice). I went a bit out of my way to ride the one from Warren to Ashtabula, about 70kms through the woods.

Next time I think I'd take the train to Cincinnati and ride the Miami bike trail to Dayton. Or given more time take it to Cleveland and ride through the Cuyahoga National Forest to Canton and follow the Adv. Cycling Underground Railway route to Dayton from there via Yellow Springs. Speaking of that organization, they have a new route I am interested in: Sierra Cascades: http://www.adventurecycling.org/routes/sierracascades.cfm?email=20100503. Lots of high points along there to operate from.

On the Ohio tour I wound up doing 100% credit-card, so carried the camping gear for nothing. But it was only 12 lbs. I think I'll go ultralight from now on. BTW that Yahoo group I mentioned at Dayton is called 'ultralightbiking'. Some good (if extreme) ideas in there.

73 and keep the rubber side down.

Barry

From: Mickey Applebaum
Topic: 2361 Message: 2361

Hello all in the group,

I am still looking for communications (HAM) operators and drivers to assist with this year's American Diabetes Association's Tour de Cure in Brigham City/Box Elder County Utah on June 12th.

We need between 2 and 8 shuttle drivers/comms (these folks will be driving vehicles provided by Larry H. Miller and Hansen Chevrolet.

I am also looking for 2 or 3 more SAG drivers/comms.

Contact me ASAP if you would like to help.

Thanks

Mickey

Hi Barry,

Just a thought - from Cincinnati to Xenia on the Little Miami trail (and Xenia connects with other towns like Dayton) is mostly uphill. So if you are going one-way, you may wish to start your travel somewhere up north, like around Xenia, and work your way south.

Xenia is a hub for several trails. See http://www.miamivalleytrails.org/station.htm There are numerous bicycle shops there as well.

If Ohio gets their 3-C train going (Cleveland, Columbus, Cincinnati)...you may have more options where you start your trek, since it sounds like you prefer rail travel.

I have a homemade bracket on my Schwinn Searcher that I can hang my handheld, using an aftermarker antenna attached direct to the ht, and speaker mic. I picked up an earpiece/mic combo at the Hamvention I plan on trying out on the bike. Once and while I can get someone to talk to me on one of the local repeaters. I'm not native to the Dayton area but travel there frequently.

I did ride my bike to my 50th high school reunion in 2008. The ride is
422 miles from my house in Illinois to the motel in Greensburg PA with
another 10 miles to St. Vincent College in Latrobe PA. The High School
closed a few years after my graduation due to a fire that destroyed much
of the buildings that housed the Prep. I do have to admit that it was on
my big yellow motorcycle but there are hills in them thar parts.
As a side note, there is a ride called the Chestnut Century mapped by
the Western Pennsylvania Wheelman that was sent to me after a request
for routes in the area a number of years ago. It was described as a ride
"few" of the members could complete. I took my bicycle the next year and
completed the ride of 100 miles, seven times over Chestnut Ridge, the
first ridge of the Allegheny Mountains, knowing full well why it was so
described. A couple of years ago, 2006 I think, I rode the route on my
motorcycle on a Sunday morning and could not believe I had ridden up the
grades I found.
Sometime over the last few years I've lost the snap in the legs I once had.

From: Mike
Topic: 2357 Message: 2364

My ride to my 50th was a good one. 3 days total with 180 miles being ridden. Weather was good and had a tailwind 2 of the 3 days. No rain, no unusual events, trucks didn't run over me and had a great time. The only downside was that I could not raise anyone on the repeaters, I hollered many times on several repeaters and not one soul called me. I am wondering if this is a trend and do others find this same silence when you bring up a repeater and try to make a contact. I did twitter and did facebook along the way. Twitter has a bug in it that I cannot accept any who request to follow me. I changed my profile so anyone could follow, hope that a few did. Facebook was with the family and I had lot's of encouragement from them.

Of the 13 in my class, 8 were there. Not bad for 50 years and of course all of my classmates are successful and perfect health, hah.
I did have a good time however meeting with all of them. Great class.
I will have to do it again at our 100th!

Article and pictures to follow.

Hopefully this will inspire others to do the same, let's keep Hartley's tradition going

>
> As time progresses, next Saturday is my 50th High School Class Reunion and I plan to do exactly what Hartley did. I am very lucky in that my High School is only 180 miles from my home and Hartley's was over 1200 miles. Even though it's on a much smaller scale, I do plan to ride from South Sioux City, Nebraska to Hampton, Nebraska taking three days to ride the route. I am going minimal, staying in motel's and foregoing rain gear, taking very little. I do plan to take my duo-band HT and hope to talk to a few of the locals on the repeaters on my way down to Hampton.

Regarding silence on repeaters.

Mike,

I'm truly sorry to hear about the lack of repeater activity.

For years I long-hauled the lower 48 states and Canada with an 18-wheeler and always kept a 2-meter rig on. Once while laid over in Indianapolis I found a friendly repeater group and even engaged in some old-time packet to while away the long hours. But for the most part I never had much luck as a stranger on a repeater.

One time, prior to cell phone days, I found a 4-year-old boy hiking on the northbound shoulder of Interstate 5 in Oregon. I brought up a repeater and announced I had an emergency and described the situation and asked for help but no one responded. With child molestation and kidnapping laws as they are, I didn't dare set him in the cab or drive him somewhere. After ten minutes I broadcast oveer the repeater that everyone within the range of my voice could take an equal share of what happened to this little boy once I drove away. A gravely voice came on, announcing that he would take case of it, but he issued no call sign. I sat on the running board and stayed with the boy until the police arrived. And I never heard the end of the story.

When I leave home I operate on 146.52 simplex, or not at all.

A lot of factors are involved with getting a response, including (but
limited to) ..

What time of day was it?
What day of the week was it?
Obviously you were not a "local" with a recognizable call sign .. so did you
add something to your call to "sweeten the pot" so to speak? Like adding
"bicycle mobile" or "bicycle mobile from xxx to yyy"?

Just throwing your call sign out may not be enough. Not every ham who is
listening to a repeater talks to any ham that calls ... even hams that he
knows ... and more so hams that he does not know .. unless there is some
reason other than a random QSO.

For example, on your "home" repeater .. if you are in a QSO with one, or
two, or three other folks ... I'll bet that there are at least that many who
are listening only, and not in the conversation.

I have APRS on my bike but don't know if the websites will have the data
you are looking for or if there is a program you could use at home such
as UIview to collect enough granularity of detail.
Good luck

There are several ways to accomplish this... The Byonics MicroTrak AIO is a complete, all in one, battery operated tracker with an 8 Watt 2 Meter transceiver built into a small yellow case that can be strapped to your bike... You can the use www.aprs.fi to look at where you have been along with historical data stored on their site...

Another option is to use a GPS enabled phone (like a Blackberry or iPhone) and use the appropriate application from www.mapmyride.com and you can track your rides (along with a bunch of other data) and have printable maps from your rides...

I have used GPS on my bike for many years. Bike or wrist mounted GPS units record data far more frequently than APRS devices should reasonably sample so they give more accurate tracks. If the APRS track were sufficiently accurate for your purposes, I do not know a method exists to easily transfer the track to track mileage. The APRS data is available online so one could download data for a particular ID/call, parse it to extract the lat/long data, enter the data into a spreadsheet (as a crude way to prototype this) and calculate route statistics. As personal GPS devices do such a good job with this and plenty of software is available to analyze the data, why use a radio?

I purchased a micro-trak AIO but find a cell phone in my jersey pocket reports my location via Google's Latitude so my wife can easily predict what time I will arrive home when commuting from work.

Thank you everybody for your replies. It seems like my limiting factors will be the distance to the repeaters and rate of transmissions. I guess if it only transmits every 2 minutes, it won't be as effective. I'll look into this option or think about just getting something made for this that doesn't involve ham radio, a gps bike computer.

Thanks,

Mike

2374. RE: [BMHA] APRS Tracking on Bike

Yahoo group: BMHA
Date: 2010-06-13 13:45:36 UTC
From: Mickey Applebaum
Topic: 2368 Message: 2374

My wife has the new Garmin 500 w/Heart Rate and Cadence... she loves it, but it doesn't do the on screen mapping. It does have the ability to download your ride GPS info to the on-line services (i.e. MapMyRide, Google or Garmin's) and then convert it to a map.. so it's a question of how important is on screen display while you are riding? Right next to her Garmin on her bike, and on my bike is the Blackberry mount where we clip in our 8530 Curve's. Then we turn on the GPS mapping display and we get our "heads up" dynamic map display (I have the MapMyRide application installed and then I can upload my ride info). Oh, and we just found (although it may have been there in the older model Curve we had) that we can push the button while in the GPS map application on the Blackberry and post uur location to several different options including Email, MMS and Facebook.

2375. Re: [BMHA] APRS Tracking on Bike

Yahoo group: BMHA
Date: 2010-06-13 18:59:49 UTC
From: Toby Markowitz
Topic: 2368 Message: 2375

I have used the Garmin Forerunner 405, Forerunner 301XT and Edge 500. All the units allow loading of "courses". The 310XT and the 500 will display a map of the course. We plan routes with Bike Route Toaster and then download them to the GPS units although other websites have similar capabilities. I annotate the routes in Training Center. While I used to annotate with turns, I've ceased that as the map display of the course is so useful.

I rode our local Tour de Cure last weekend; I marked each rest stop on the course. As we left each rest stop, I informed the riders around me how far it was to the next rest stop as my watch gave that indication. Today, we did a 44 mile ride in rural Wisconsin. I marked the beginning of major climbs, the summits and the half-way point. As we cruised along the valley, I informed my fellow riders that we had a climb coming up which allowed everyone to be prepared.

I can see about 0.5 mile ahead with the course display. It does not show intersections but does show where the course takes a turn. The turn might be a turn in the road or it may be an intersection requiring turning from one road to another. A periodic flip of the wrist presents the map display and the route is clear, even for me, a rider who requires reading glasses.

I started many years ago with a handheld GPS mounted on the bars of my bike, a Garmin Vista first, then graduated to a Vista C. From the Vista C I went to the 405 and then the 310XT. The Edge 500 I mentioned is my wife's although I used it, early on, to understand how it should be set up. The 405, 310XT and the 500 also record heart rate in addition to the GPS data. Other accessories are available such as cadence and power meters but I have not used those. These three units, as I describe their use, are without wires on the bike. The heart rate data is wireless from a chest strap. The 405 and 310XT transfer to my home computer wirelessly.

I bring the bikes to my basement shop and hang them up; the watches get connected to wall wart chargers and transfer their data so when I finish up and head to my home office, upstairs, the data have been transferred, Garmin's Training Center has opened and the data are waiting on my monitor. The Edge 500 does not transfer data wirelessly, unfortunately, but requires a USB connection.

The fascinating part about course following with these GPS units is that we distribute our routes electronically and we feel less compelled to ensure everyone makes each turn. Riders who have GPS and who are either ahead or behind can simply follow the GPS route. Bike Route Toaster, like some other websites, will not only allow one to plan a route but also generates a turn list.

The GPS devices have become a regular part of our bike paraphernalia. For rural rides, they work where cell phone coverage is spotty or non-existent and they are resistant to water damage. The 310XT is even certified for use when swimming as its design targeted tri-athletes.

Just for completeness, add the GPS-equipped smartphone to your list of options. I've used both Trackr http://www.trackr.eu/ and GPSed http://gpsed.com/ for several years and they both work well. If you have a suitable data plan and are in range of cellsites, you can enable real-time tracking, otherwise what I do is just log GPS data on the phone and upload it to the website after my ride. You can export data in GPX format for viewing in Google Earth, elevation profiling, or anything else you can do with GPS data. I don't use the real-time map display and appreciate being able to use the phone that I'd carry with me anyhow. Although you must have a suitable phone and data plan, the web-based services are free. I use the Windows Mobile version, but both support all major smartphones.

There is a cool website that makes it easy to look up and analyze aprs position files, and stores the data for at least several years:
http://www.db0anf.de/app/aprs
You can poke around in there and find all kinds of interesting stuff on any aprs system that has been transmitting data.

I like http://www.aprs/fi with it's real time updates and the ability to fine tune the display from between 12 hours of traffic to 15 minutes of traffic... I have used it instead of UIView when doing support for LOTOJA and other rides.

From: stegnography
Topic: 2351 Message: 2379

I have spent several days on the road now and I have some observations that might help folks get some responses when calling in to repeaters.
1. When you are making your call in to the repeater see if you can capture a little bit of road noise to be picked up. Too much will make your call unintelligable but if you can get a little bit of that doppler shift of a vehical going by it differentiates your call from all the others.

2. Have a real reason for the person to pick up the mike. My first QSO of the trip was when I entered florence and asked for advice where to get brekfast. Hams want to help. They may not feel the need to chat. Once you get your information request filled let them make the decision if they want to keep talking.

Hello, I'm new to the group and happy to have found fellow hams and riders. This is an interesting post to me since I've been looking at APRS tracking for both my bike and my boat. It seems to me an easy solution would be to buy one of the Yaesu HT's.....radio/gps/tnc/ant all in one package. I'm in need of a new HT so I thought this would be a nice solution as well as being very portable.

Has anyone taken this approach? I'd be very interested in opinions and results.

Thanks

Steve

This is an approach that I have investigated for when I can afford to purchase a new radio for both myself and my wife's bikes... the problem is the size of the mic and mounting the radio, not to mention riding in bad weather days.

I don't get the problems listed. A zip-lock large quart size freezer bag is easily slipped over most any bicycle-radio setup, weighs almost nothing, and is easily "packed along" with the other necessities of bicycling. Barring that, the electronics can be disconnected and placed in panniers or back-packs for the duration of a storm encountered while riding.
The new Yaesu VX-8D with built-in GPS is advertised as being water resistant. Most of us will not want to intentionally "test" such specifications, but it offers assurance that the radio will survive at least minimal amounts of moisture should a storm catch us unawares.
I've been running voice and APRS on my commuting bike for 2 years now, and have missed maybe a month of riding within those last 2 years. I use the Kenwood TH-D7 radio and a Magellan Gold GPS mounted on a homebrew handlebar bracket. The D7 is by no means rated for exposure to ANY amounts of moisture, but it has gotten wet in a few storms before I could get it packed inside the pannier and off the handlebars. No problems have ever been experienced. I've also suffered no vibration damage to the radio or GPS. So take the worry-wart comments about "exposing your precious radio to vibration and elements on your bike" with a grain of salt. I love having both voice and APRS running on the bike, and if I had to replace the radio or GPS every year from wear and tear I think it could be counted as cheap entertainment. Since all electronics are still running fine with no damage from ~4000 miles a year on the bike, I'm the proverbial happy camper.

My wife rides century tours on a full out road bike. Her bike is set up for the lightest weight possible and speed (2010 Specialized Ruby Elite). Mine, on the other hand, is a street hybrid with lots of excess weight so the weight of the radio and size of the mic are less of a problem for me than for her.

Agreed that the new "waterproof" Yaesu will help in inclement weather.. another reason why I have been looking at it, but it will not be as weather resistant as the Byonics AIO in the waterproof case.

On the "event" rides where my wife has the radio on the bike she acts as one of the SAG operators, allowing us an on the road idea of what's going on in addition to the in the vehicle viewpoint. Vibration/shock has never been a problem for her ICOM D90A, what we've had fun with is mounting an antenna on the new bike. On her old bike the antenna fit perfectly strapped to the vertical seat tube (all carbon) but on the new bike it's shorter due to the design of the frame so we are looking at getting a shorter antenna for the new bike.

As for mounting the radio, same deal... on the old bike the stem post was longer and we were able to strap the radio to the stem post. On the new bike it's almost non-existent and so we've been trying to find a place to mount it. I'd love to find a mount like the one I found for our Blackberry's, that would be perfect.

Topic: 2368 Message: 2384

All good inputs...thanks....my wife and I ride a couple of the Rans Crank Forward.....I keep thinking that an HT inside a rack bag with an external antenna attached to the rack, if needed, would work well....as far as the mike is concerned, I have no experience but wouldn't a bluetooth setup work well....I know I'm probably talking the gold standard now and lots of money but installation would be simple, and the radio is out of the weather.....in my case it also makes it easy for me to take it on my boat when needed. Has anyone tried this or have any experience with the Yaseu radios and can give us a yeah or nah as to how practical this would be!
Thanks

Topic: 2368 Message: 2385

A friend of mine has the Yaesu and the bluetooth... problem when set to VOX mode was it picked up wind noise (while in his car, not on a bike which would probably be worse) and keyed when it shouldn't have and when not in VOX mode it was difficult to key.

I got myself a Ghost Headset that uses piezo bone conduction mic pickup built into the earpiece (part of the Klein Electronics Modular series http://www.discountcell.com/cellular/p/KMODULAR-GHOST) with the control box and separate PTT button (that fits perfectly on the handlebar near the shift and brake levers) that I also use on tactical call outs with our ARES group and everyone comments on how clear and easy to understand my transmissions are. There is also a Ghost Lite that appears to not be a modular system, but it is limited to the radios you can connect it to. http://www.hitechwireless.com/Ghost-Lite-Earpiece-P1177.aspx

Klein also has their complete Bluetooth offering... http://www.rocketquality.com/bluetooth.html

My wife doesn't like it on her bike because of the extra wires that have to be routed... we haven't tried the Bluetooth stuff yet.

>>> k3wkm<evetsmd@...> 6/16/2010 4:22 PM >>>

All good inputs...thanks....my wife and I ride a couple of the Rans Crank Forward.....I keep thinking that an HT inside a rack bag with an external antenna attached to the rack, if needed, would work well....as far as the mike is concerned, I have no experience but wouldn't a bluetooth setup work well....I know I'm probably talking the gold standard now and lots of money but installation would be simple, and the radio is out of the weather.....in my case it also makes it easy for me to take it on my boat when needed. Has anyone tried this or have any experience with the Yaseu radios and can give us a yeah or nah as to how practical this would be!
Thanks

That ghost headset looks like a nice option, thanks, I can see how wind noise could cause a problem with VOX.
It seems the Yaesu radio set to APRS on one band and 2 mtrs on another would be a nice setup.

hopefully someone who has been doing it this way will check in and give us first hand input.

I have a VX8 (bought last fall so it's the older model that mounts GPS on the speaker mike or on the external mike jack). The APRS config supports APRS beacons and monitoring APRS traffic on 2M and simultaneous operation on any band the radio transmits on using the other VFO (as long as you have connected a suitable antenna for both bands). My normal use is with both bands set to 2M. I have not noticed any interference between the 2. (I am having a brain fade on this but believe the APRS beacon is delayed if you are transmitting on the other VFO).

The additional battery draw from the GPS and APRS beacon will reduce your battery life. A spare battery (good practice if you are providing comms support for an event anyway), or external power (if the weight/volume isn't an issue for you) fixes that problem.

I need to look into those b/t systems - wind noise is a problem with my cell phone b/t units. My current preference is a wired earpiece so I can hear any traffic clearly and I slow or stop if I need to transmit; I clip the speaker mike to the shifter cable. Works well enough...

I have yet to hear about a reliable BlueTooth system either at home or on the road when used with a 2-way radio system.
My complaints with B/T include:
-The headpieces are nowadays only slightly smaller than the device they are wirelessly "connected" to.
-The audio is never entirely clear. There seems always to be some sort of digital buzz in the audio background, and the loss of fidelity compared to a wired microphone is objectionable to me.
My latest experiment in wired bicycle radio microphones seems to be working, with good audio reports even on windy days. I found this vendor via an Ebay search and the price and quality are good, and the headset/microphone system works very well. Take a look at the system and see what you think:
http://cgi.ebay.com/2-Pin-Motorcycle-Helmet-Headset-Kenwood-Radio-TH-D7-/220584814791?cmd=ViewItem&pt=2_Way_Radios_FRS&hash=item335be128c7
If this link doesn't work, try an Ebay search using the words "th-d7 motorcycle".
The cost is 20 bucks and shipping to my QTH was 6 bucks.
It has a quick-disconnect that saves the radio and cabling in "difficult situations". I cut off one of the earpieces and use only one. This is designed to be mounted inside a motorcycle helmet but is not hard to apply to the smaller bicycle style helmet.

That headset is from one of the Klein Electronics companies product lines... It's the RiderComm Motorcycle Headset

http://www.headsetusa.com/ridercomm-trade-motorcycle-helmet-headset.html

which is another one of their modular systems... The price on Ebay is great, considering the whole modular system (headset, remote PTT button and radio interface cable) would come to around $120. I would ask if it was new in the box, but the last stuff I got from Klein wasn't in a box, it was in plastic (static free) bags. For noise reduction and clear reception I really like my Ghost earpiece... http://cgi.ebay.com/Ghost-Lite-Earpiece-Assorted-Radios-GhostLite-S1-/370296140773?cmd=ViewItem&pt=2_Way_Radios_FRS&hash=item56375eb3e5#ht_1384wt_991

2392. Antenna setup for bike commuting

Yahoo group: BMHA
Date: 2010-07-09 05:03:16 UTC
From: jrswenberger
Topic: 2392 Message: 2392

Hey All,
I'm looking to put a bicycle mobile rig together for my commute to work. I'll likely be using a 10 year-old Kenwood TH-G71 dual band HT mounted to the top of my handlebar bag.

My question revolves around the choices of antennas for repeater and local simplex operation. I have a friend that is really talented in metal fabrication so I'm thinking of mounting a custom bracket of his to the underside of the rear rack. This bracket will extend a few inches beyond the rack to allow for mounting a 2-3' threaded rod topped by an antenna mount.

I am wondering what type of antenna would give me a reasonable signal from a setup like this. Would it work better to have separate UHF and VHF antennas or a single, multi-band setup?

Thanks for thinking about this,
Jay K6JRS

Thank you for sharing your setup...very nice work....my only question is how do u get on and off the bike. Seems like the antenna would be in the way....seems to me some lay down feature for the antenna would be ideal.

I use fiberglass bicycle flagpoles, available at most Wal Marts for $3.00 or so, attach wire and welding rod to make it into a J pole.
See http://www.qsl.net/w5aox/images/JPole_W5AOX_Bike.jpg for this easy to make, very effective antenna. Mine also work on 440 as is, not with an optimal pattern of course. But it does have a reasonable SWR on 440 so it functions as a whopper antenna on 2 and a usable one on 440. I used the J pole to check in with the 75 meter NM Breakfast Club this morning..... using the Kenwood TH-D7 on 444.150 thru the J pole to the local remote base of course.
The mount is easy... I just mount a 3 or 4 foot length of 1/2" fiberglass pipe to the back rails of the bike and drop the J pole into it when going for a ride.
See http://www.qsl.net/w5aox/W5AOX%20APRS%20BikeMobile.html for photos of my mountain bike configured this way (I also have a roadie DF and my recumbent configured likewise).
The usual dual-band Comet antenna mounted on a back plate works well too but costs more, doesn't contribute to your visibility, and the antenna pattern closely couples into your backside.
Getting on and off the bike..... almost any antenna (unless you put it on a LONG outrigger bracket) will force you to be careful getting on and off. I hoist my leg(s) over the middle between the seat and the handlebars; no more leisurely flinging the hind leg around the back of the seat.
W5AOX
http://aprs.fi/?call=W5AOX-6&mt=roadmap&z=11&timerange=10800 track me on my recumbent...

Hello all,

On September 25th one of our local organizers is putting on a century ride in the Heber Valley area of Utah. The ride will generate funds for the Huntsman Cancer Research Institute. If you are interested in riding with your gear on your bike (there are 4 route distances, 100, 65, 50 and 25 with a Bi-Athalon option as well) we can get you signed up as a ride marshall. If you would like to help out in other ways, we could always use SAG and Shuttle drivers. More info on the ride is available at http://web.bike2bike.biz/Rides/HeberValleyCenturySept252010/tabid/111/Default.aspx

Thanks

Mickey

From: Kelly Gray
Topic: 2288 Message: 2396

It took me a while to get used to getting on and off the bike. I get on the bike by swinging my leg over as usual, but keep my leg bent at the knee instead of stretching it out as you would usually do. Learning to do that cost me at least one broken whip from the repeated kicking and straightening of the antenna but I eventually learned. Now I do it without thinking, even if I don't have the antenna mounted.

2397. Antenna for sale

Yahoo group: BMHA
Date: 2010-07-29 05:42:10 UTC
From: Al
Topic: 2397 Message: 2397

For sale: Larsen OM150CK.This is a no ground plane, end fed, permanently attached cable, Two Meter antenna.Black base, stainless whip.I originally bought this antenna for bike mobile, and I did use it on the bike a few times, but it spent more time on the roof of my truck.I'll include the modified clamp on mirror mounting bracket I used.This antenna sells for $70.00 new, from AES.Asking $30+ shipping.If interested, reply direct, off list.

2401. A Query

Yahoo group: BMHA
Date: 2010-09-16 18:04:42 UTC
From: pitchingfork
Topic: 2401 Message: 2401

At the McKinney ARC September meeting we enjoyed a QSL Card Show and Tell. It was a lot of fun and very interesting. Some of them could have qualified as historical documents. One was issued from the time when 11-meters was still an amateur frequency.

Is anyone interested in doing a similar thing on this BMHA reflector since an eyeball meeting would be impossible for most of us? Of course it would have to be radio and mobile/portable bicycle/tricycle related to be of interest to this group. The creative artwork, in my opinion, are less important than a verbal description of the folks and the conditions when a certain QSL was earned.

Perhaps the newsletter editor would be intersted in devoting a page to QSLs when it comes time for another issue?

2406. My Sun X3 Trike

Yahoo group: BMHA
Date: 2010-09-30 21:57:27 UTC
From: pitchingfork
Topic: 2406 Message: 2406

I've added two photos to N7NET's Stuff album.

I chose the X3 because I felt I was a bit more visible.

Fifteen years ago I bought a Bike Friday Tandem Two'sDay and trailer frame from Green Gear in Eugene, Oregon. I've towed the trailer with the Two'sDay, Burley Samba, Bike Friday New World Tourist, Cannondale and now the trike. The trailer frame and Bike Friday provides the counter poise for 20-meters. I'm hoping it will provide enough for 40-meters.

The hitch itself is an air chuck. In order to attach it to the trike I used an inch dowel rod cut to accomidate two existing vertical tabs. How well it performs is forth coming.

2409. KX1

Yahoo group: BMHA
Date: 2010-09-30 22:52:48 UTC
From: VE3JC John Cumming
Topic: 2404 Message: 2409

I would suggest that neither the KX1 (which I don't own) nor the K1 (which I do own) are good choices for bicycle mobile because it is not possible to lock the dial. With normal vibration encountered in bicycle mobile operation, the inevitable frequency changes would be intolerable. With the K2, on the other hand, you can lock the frequency (and of course enjoy ssb bike mobile as well).

73, John VE3JC

ps I'd be delighted if someone proved me wrong with respect to the K1 !

I know about Elecraft but had not heard of the KX1. Of course, I believe in the adage "Life is too short for QRP." so I don't pay attention to QRP rigs. I also don't operate HF mobile. I want VHF/UHF on my bike but not HF. I'm not trying to tell anyone else their operating preferences are wrong, just letting you know what mine are. I also think amps are way over rated.

From: JP
Topic: 2412 Message: 2412

Hello.

I've done bike mobile with my ht. The rig - v1 - that I created for my Burley trailer is in the N3TOP-Jeff folder.

This was created for my support of the MS Challenge walk.

Many small changes remain. Including actually putting a larger radio and real antennas. Also will change the PVC to 1" and some angles to get a level platform. The Yellow discos had crummy lamps so those will be replaced with LEDs.

I hope to have the system really ready for multiple events next year. Maybe even some marathons, including the Marine Corps Marathon.

Jeff

Jeff,

These bicyclde mobile projects are always a work in progress. The PVC you mention, how does it fit in?

Larger radios require larger batteries which is more weight. For some folks that's not an issue.

In the AES catalog Lakeview company used to sell a 2m half wave antenna. I don't have a catalog at the moment.

Please include your call when you post.

Actually it is no antenna. I got to the start and realized that the one thing i forgot was the antenna. As my antenna-fu is weak all I remember is that is is one that does not require a ground plane.

If you look at the picture, there are three plates, the middle was for the antenna and the outer were for the lights.

The rig was set to use my ft-530. Once my VX-7 is fixed that will be put in the trailer
and I will need a better antenna solution. The long range goal will be to put APRS running off an HT while I use the mobile for voice.

I have a lead acid set*, and 2 NiMh batteries with no charger yet. (still looking).

73. N3TOP

* The battery is one of those all in one accessory/car jumper thingies that I got from Harbor Freight. The plan is to break that down and get rid of the car jumper subsystem.

Jeff,

Have you tried a coaxial type 1/2 wave antenna?

I run a recumbent with a 1/2 wave coaxial antenna taped to a old fishing pole. It sits up over 6 feet height and gets me out with my VX-8 voice and APRS.

I wrapped it with yellow tape for visibility , and I also have a hustler antenna for HF, that's for my FT-817.

No amps, a gell cell in an old ammo can. I'll post pics soon.

Although the KX1 has no dial lock, it would be a fairly simple mod for an owner to add. The KX1 uses a DDS synthesizer and an optical encoder; all you would have to do to implement dial lock would be to disable the outputs from the encoder.

The K1 uses a VFO, so there would be no simple way to add dial lock to that radio.

Subject: [BMHA] KX1

I would suggest that neither the KX1 (which I don't own) nor the K1 (which I do own) are good choices for bicycle mobile because it is not possible to lock the dial. With normal vibration encountered in bicycle mobile operation, the inevitable frequency changes would be intolerable. With the K2, on the other hand, you can lock the frequency (and of course enjoy ssb bike mobile as well).

73, John VE3JC

ps I'd be delighted if someone proved me wrong with respect to the K1 !

2420. Shameless Bribe for BMHA Newsletter Articles

Yahoo group: BMHA
Date: 2010-10-07 16:34:37 UTC
From: Mike
Topic: 2420 Message: 2420

As many of you know, BMHA is an affiliated club of Adventure Cycling. They have provided me with 10 free membership vouchers and 100 Special Edition Magazines.

It is becoming time to gather articles for the next BMHA Newsletter so I am offering my shameless bribe again of one membership voucher for each BMHA Newsletter Article. You can send me the article or our Newsletter Editor, N9ZKS. My email is: nf0n@... and Norm is n9zks@earthlink.net

Once the newsletter article is received I will mail the membership voucher. These are only good until the end of 2010 so send soon.

The special magazines will be given out at the next Dayton Hamvention BMHA Forum.

Volunteer speakers for the next BMHA Forum will also qualify for one of the membership vouchers. If you are interested in speaking or demonstrating at the 2011 BMHA forum, contact me with your offer and I will mail the membership voucher.

Start flooding us with those newsletter articles.

2421. Longbikes Slipstream Long Wheelbase Recumbent ordered

Yahoo group: BMHA
Date: 2010-10-07 16:54:47 UTC
From: Mike
Topic: 2421 Message: 2421

As some of you may know, I am a recumbent rider. Although I do have a mountain bike, I ride a recumbent nearly all of the time. Some have said that a true recumbent rider will have a short wheelbase, long wheelbase and a trike. I have all now with the new purchase. Since I like to tour at times I wanted a good strong one that would give some options to tour and mount HF or VHF antenna and radio. After doing hours and days of internet research I settled on the Longbikes Slipstream made in Englewood, CO. The Slipstream is the successor of the Ryan Vanguard which Longbikes purchased the manufacturing rights several years ago. Last weekend I made a trip to the Englewood factory for a test ride of the Slipstream. Greg Peek is the manufacturer and he allowed me to ride one of his original Slipstreams made in 2002. I have placed several pictures in the Photos section of this bike and you can see just the bike itself and old ugly heavy me on it in another picture. After about a 25 mile test ride I determined this is the bike for me. One is on order for delivery in May 2011. Greg is a true craftsman and is going to make a mount for me. If you look at the frame tube that comes up behind the seat at about a 45 degree angle, he is going to extend it up to about seat height. It will allow a Diamond mount that can be adjusted for several angles and can mount a hamstick, VHF antenna or it should be strong enough to mount a Little Tarheel II for HF. This should give me lot's of options for antenna mount's. On the front where a water bottle mount is normally, he put's 3 holes and I should be able to mount a plate with radio, an HT or possible a FT-817.

I already have a trip planned next year so now I have to get everything ready during the winter and earn enough to complete the purchase.

For any looking at a long wheelbase recumbent, I would surely recommend the Longbikes Slipstream.

Mike, NF0N

Hi Mike,

A couple months back my local radio club, McKinney ARC, proposed a QSL Show and Tell night. Not everyone participated in the showing, but there was an overflow crowd of lookers. In my opinion the program was successful enough for a repeat performance.

I posted a similar suggestion that the editor might wish to compose a page of QSLs for the forthcoming newsletter. Not everyone finds joy in stringing words together, but almost anyone would find some pleasure in boasting about his/her favorite QSL with a short description of how and when it was earned.

Scott

Hi Folks,
I just wanted to give you an update and tell you I am less than 750 miles to the completion. If you would like to track my progress go to Lemonademagnate.com password is lemon.

If you live along the Transamerica in Kentucky or Virginia and would be willing to put me up for a day or two I would be grateful.

Dean

2428. BM newbie: questions & my setup so far

Yahoo group: BMHA
Date: 2010-10-25 19:02:31 UTC
From: John Goerzen
Topic: 2428 Message: 2428

Hi Bicycle Mobilers,

This morning, I took my first bicycle mobile ride. It was fun, though didn't perform quite as well as I had hoped. I'd like to tell you what I've got, and see what suggestions people may have. If this is too long, tell me and I'll send a more concise version ;-)

I typically ride from home to work, a distance of about 10 miles each way. 3 of those miles are on sand, gravel, or dirt roads. The remaining parts are on 2-lane paved roads, and the final mile or so is in a small town.

I ride up to 4 days a week, and of the ride, all except 10 minutes will be available for radio work (those 10 minutes have me in a ravine that cuts out signals even on my car or cellphone).

My goals with this project are these, in general order of importance:

1) To be able to reliably hit the three repeaters I care about:
* a 2m at a distance of 15mi
* a 2m at a distance of 30mi
* a 70cm at a distance of 20mi

for mainly ragchewing with locals.

2) To keep my initial setup as simple and inexpensive as possible

3) To be able to use in a temperature range of 10F to 110F, and during rain when temps are above 50F. Wind tolerance must be at least 40MPH. (I live in Kansas!)

4) The setup shouldn't impair my personal safety

5) Impact on my cycling speed should be minimal

6) Listen to FM radio when there is no traffic on the repeaters

My current setup runs like this:

Antenna: 2m/440 dual-band vertical which is half-wave on 2m. I have not yet tuned it past what it was at from the factory. (I don't own an SWR meter or analyzer and need to borrow someone's.)

Antenna mount: standard automotive NMO mount attached to my bike rack on the rear of the bike

Feedline: RG-8x from the NMO. PL259 at the end, which is along the main top bar near the front. Short PL259 to SMA adapter cable from there to radio. Plastic zip ties attach it to the frame. I put electrical tape

under the frame to protect the paint from abrasive scratches from the zip ties and PL259.

Radio: Yaesu VX-7R submersible that I already owned.

Radio mount: Arkon SM327 http://www.arkon.com/bicycle_handlebar_mount.php

Headset: Pryme SPM-400D that I saw recommended at http://is.gd/gikQ0 - URL to that headset is http://www.pryme.com/products/headset/SPM-400D

PTT: Remote PTT from the SPM-400D, mounted on the handlebars

Bicycle: 2010 Specialized Tricross Sport Triple

The result of my first ride, and a couple of brief tests:

I was able to get into the repeater 15mi away very well. I expected as much, as I was able to get into it from even farther locations even with a rubber duckie antenna. No problems at all. Alas, this repeater has the least traffic of any.

The 30-mile 2m repeater was a bit iffy. I got reports that I was not at full quieting. though the people I talked with seemed to have maybe a 60%-90% copy.

The 70cm repeater I didn't hear any responses today, though I did hear the roger beep after my transmission. I did hear from it during tests before so I suspect I'll be OK.

All people I talked with mentioned wind noise as a problem. It didn't prevent communication, but perhaps made it more annoying. From my side, the setup worked OK. Some wind noise in my ears but not too much. Winds this morning were 15MPH, headwinds for 3mi and crosswinds for the rest. This is about 5-10MPH less than will be typical for afternoon rides some seasons.

The SPM-400D otherwise works out reasonably, though I have something of a nest of tangled cables by the radio.

The SM327 radio mount is a nice design, though I may need to reinforce the radio a bit; it fell out as I rode over a spot where water had eroded a large bump on the dirt road.

So, my questions:

1) What can I do to boost performance into that troublesome repeater?

2) What's a good wind screen (or whatever) to cut down on the wind noise from my microphone?

3) What other suggestions might you offer me?

Thanks,

-- John Goerzen

The link to your headset shows a rifleman using the earpiece with a foam windscreen over the microphone. The picture underneath it doesn't show such a thing, and none are listed in the accessories link. You might try cutting a small block of foam packing from one of the ubiquitous pieces we all save from incoming shipments and poke a small hole in it just enough to fit over the microphone and see if it helps.
My mike looks a lot like yours but has the foam sock on it, and I rarely get wind noise complaints any more.
Here's a link to my favorite headset, and the mfr makes them for Yaesu as well:
http://cgi.ebay.com/2-Pin-Motorcycle-Helmet-Headset-Kenwood-Radio-TH-D7-/220584814791?pt=2_Way_Radios_FRS&hash=item335be128c7

you didn't include a photo so I'm guessing you could elevate your "half-wave" antenna with a piece of PVC or fiberglass small diameter pipe/tubing so more of the radiation pattern would be above your back and hopefully your head. Height=gain. The tip of my homebrew J pole is about 8 feet in the air.... yes, it's a tree detector, but it does hit all kinds of repeaters and doesn't do too bad even on simplex. My J pole bends when it hits overhead branches; it helps if the antenna rod has some flexibility.
Remember the basic laws of ham physics apply to bikes and cars as well as home stations:
"If it stays up all year, it isn't big enough or high enough."

I love my Klein Electronics Ghost headset... it uses an in the ear bone conductive microphone so there is 0 (yes, ZERO) wind noise.

Oops.. forgot a link... You'll need to get the specific radio jack to go with the headset... but this is the idea.

>>> John Goerzen<jgoerzen@...> 10/25/2010 1:02 PM >>>

Hi Bicycle Mobilers,

This morning, I took my first bicycle mobile ride. It was fun, though didn't perform quite as well as I had hoped. I'd like to tell you what I've got, and see what suggestions people may have. If this is too long, tell me and I'll send a more concise version ;-)

I typically ride from home to work, a distance of about 10 miles each way. 3 of those miles are on sand, gravel, or dirt roads. The remaining parts are on 2-lane paved roads, and the final mile or so is in a small town.

I ride up to 4 days a week, and of the ride, all except 10 minutes will be available for radio work (those 10 minutes have me in a ravine that cuts out signals even on my car or cellphone).

My goals with this project are these, in general order of importance:

1) To be able to reliably hit the three repeaters I care about:
* a 2m at a distance of 15mi
* a 2m at a distance of 30mi
* a 70cm at a distance of 20mi

for mainly ragchewing with locals.

2) To keep my initial setup as simple and inexpensive as possible

3) To be able to use in a temperature range of 10F to 110F, and during rain when temps are above 50F. Wind tolerance must be at least 40MPH. (I live in Kansas!)

4) The setup shouldn't impair my personal safety

5) Impact on my cycling speed should be minimal

6) Listen to FM radio when there is no traffic on the repeaters

My current setup runs like this:

Antenna: 2m/440 dual-band vertical which is half-wave on 2m. I have not yet tuned it past what it was at from the factory. (I don't own an SWR meter or analyzer and need to borrow someone's.)

Antenna mount: standard automotive NMO mount attached to my bike rack on the rear of the bike

Feedline: RG-8x from the NMO. PL259 at the end, which is along the main top bar near the front. Short PL259 to SMA adapter cable from there to radio. Plastic zip ties attach it to the frame. I put electrical tape under the frame to protect the paint from abrasive scratches from the zip ties and PL259.

Radio: Yaesu VX-7R submersible that I already owned.

Radio mount: Arkon SM327 http://www.arkon.com/bicycle_handlebar_mount.php

Headset: Pryme SPM-400D that I saw recommended at http://is.gd/gikQ0 - URL to that headset is http://www.pryme.com/products/headset/SPM-400D

PTT: Remote PTT from the SPM-400D, mounted on the handlebars

Bicycle: 2010 Specialized Tricross Sport Triple

The result of my first ride, and a couple of brief tests:

I was able to get into the repeater 15mi away very well. I expected as much, as I was able to get into it from even farther locations even with a rubber duckie antenna. No problems at all. Alas, this repeater has the least traffic of any.

The 30-mile 2m repeater was a bit iffy. I got reports that I was not at full quieting. though the people I talked with seemed to have maybe a 60%-90% copy.

The 70cm repeater I didn't hear any responses today, though I did hear the roger beep after my transmission. I did hear from it during tests before so I suspect I'll be OK.

All people I talked with mentioned wind noise as a problem. It didn't prevent communication, but perhaps made it more annoying. From my side, the setup worked OK. Some wind noise in my ears but not too much. Winds this morning were 15MPH, headwinds for 3mi and crosswinds for the rest. This is about 5-10MPH less than will be typical for afternoon rides some seasons.

The SPM-400D otherwise works out reasonably, though I have something of a nest of tangled cables by the radio.

The SM327 radio mount is a nice design, though I may need to reinforce the radio a bit; it fell out as I rode over a spot where water had eroded a large bump on the dirt road.

So, my questions:

1) What can I do to boost performance into that troublesome repeater?

2) What's a good wind screen (or whatever) to cut down on the wind noise from my microphone?

3) What other suggestions might you offer me?

Thanks,

-- John Goerzen

That sounds like a great device, but it looks like they don't have it in
a Yaesu version, which is a bummer!

Are you saying that it would be completely hollow inside (a hole at either end), or hollow only on the mic side? If the latter, wouldn't that muffle desired audio significantly?

I have some cheapo foam earbud covers that I'm thinking of cutting up and reusing for this.

Interesting. I'd be interested in how you build that Jpole, and how to attach such an extension pole to the bike. Would this be something I could buy off the shelf or would I have to craft it myself? I am a bit worried about increased wind resistance and the resulting torque on my bike rack, which is not really built for that sort of thing.

But I must say, that DOES sound promising, and seems reinforced by my experience this afternoon. I had the repeater at my back and they heard me well. I turned a corner that implied no change in terrain and it got much worse. (Now that I think of it, maybe there was a power line there. Hm.) I wonder if my back actually served to reflect part of the signal.

Nice setup, John.

I've done some bike mobile from my road bike (comms support for a century) and my commuter (Bianchi Castro valley, it's a steel cross style frame). I've posted a few time shere on my setup, and have photos of it (don't recall if the 2010 century mobile version is in there or not...nope, not yet!)

Radio Mount - I've become a HUGE fan of the RAM mounts system. Check message #2332 (and the surrounding thread) - I'm using a Radio: RAM-HOL-BC1 RAM Mount Universal Belt Clip Bar Holder and Handlebar/Stem: RAP-274-1-BC1U RAM Mount Universal Belt Clip Bar Bike Mount with a VX8 and a VX5, liked it so much I bought a set for each bike.

If you check the photos for my album (KS1G...), the very last picture shows the VX8 in the RAM mount on my commuter.

Antenna - you've found that bigger is better already. I have the Larsen 2M 1/2 wave NMO on my road bike - I fashioned a mount I can bolt to the back of a behind the seat water bottle cage. The photo album shows the 2009 APRS-only version. For 2010, I had the APRS tracker on one side and the 2m whip for voice on the other (the tracker worked better than the VX8's internal APRS system).

My other antenna of choice is a jpole on a fiberglass bike flag (see the 1st 2 photos in the album).

30 miles may simply be too far for 5W with a compromise antenna, or just lack of a ground plane, however. I have problems with either antenna at 5 w when I am much closer than 30 miles (terrain may be a factor for me, too). When you are in a car, can you hit the repeater reliably from 30 miles at 5W? You may have to accept the poorer S/N, or get one of the 25-30W "HT amps" and a small battery pack and run it only when you need it.

I have gone through several Pryme mikes (400-series); the earpiece did not stay put, wind noise, or a wire got caught, ... For wired boom headsets, I found a cheaper one (and can't find the link now - might be in one of my older posts...yep, McKay C1LHS, see msg #2097) - looks like they make a version for the VX7:
http://www.mckayproducts.com/store/Channel%20One%20Lightweight-Headsets.htm - C1LHS-V5
It's more rugged than the Pryme and cheaper. I zip-tie or clip the PTT to the handlebars near the right brifter for ease of access and safety. Just remember to take off the heaset when you dismount!

Hope this helps. Ride safe, have fun!

2439. KJ6CQC's route to Yorktown.

Yahoo group: BMHA
Date: 2010-10-30 13:08:04 UTC
From: Dean McCollom
Topic: 2439 Message: 2439

Folks,
Sorry I wasn't more specific on my route.
I did not have my final map broken out.
Here are the cities I pass through.
Waynsboro
Charlottsville
Mineral
Ashland,
Mechanicsville
Richmond
I finish at the yorktown battle monument.
My progress can be followed at:
WWW.LEMONADEMAGNATE.COM
password is lemon

If you are available to host me please call my cell or send an email to me at. Dmccollom...at...gmail...dot...com

I will be riding the last eighty miles with my father following in his truck. I may use a local repeater for tactical comms but likely will revert to 146.52 so if you here me. Say hi. I don't know when I will finish but if you want to meet me on the route or at the end you are welcome.

Dean. kj6cqc

Sent from my Android.

2440. A Cycling Expedition from Denmark to Sydney

Yahoo group: BMHA
Date: 2010-11-09 22:22:35 UTC
From: Thomas Andersen
Topic: 2440 Message: 2440

Hello BMHA,

My name is Thomas and the call is OZ1AA. I was introduced to BMHA by NF0N a couple of weeks ago. Very happy to see that such a group exists!

I think it is safe to say that I'm crazy about cycling and crazy about ham radio. In the beginning of October I set out on a cycling expedition from Denmark to Australia.

I'm trying to update my website with a short story from every day of the trip. You are welcome to have a look at:

http://www.cyclingtheglobe.com

After 40 days on the road I have now crossed Eastern Europe and have reached Bulgaria. Within a couple of days I will be entering Turkey.

Even though I am not carrying any radio equipment at the moment, I am certainly planning on meeting hams along the way. So far I have had some very nice encounters with hams in Poland, Romania and Bulgaria. As a matter of fact I'm just returning from a great dinner with LZ3YY, LZ3CB, LZ5QZ and LZ1QZ - all local hams of Burgas, the city I'm staying in at the moment. Isn't it a wonderful thought that you can meet people almost everywhere on the planet who share the same passion for ham radio.

I am considering to add a small HF transceiver like the FT-857D to my setup. Does any of you have experience with this radio? Also, as my budget is limited, I would love to hear if any of you have suggestions about applying for some sponsorship for such a radio? Perhaps some ideas about who to contact and how to do it?

I will be getting back with more updates as the adventure continues!

73 from sunny but windy Bulgaria!

Thomas, OZ1AA

Thomas,
In my wish, you would be operating an automatic APRS tracker on your bike. It would make it very easy to keep up with your travels, as well as seeing (of course) the hundreds of miles you'd encounter with no aprs coverage. Even though I don't talk that much on my bicycle mounted radio(s), I can't imagine going more than a few miles without them. They might, of course, complicate your border crossings, especially in paranoid places like Iran...
W5AOX

Dean,

Now, that you have finished your transAmerica ride, what is due for you next? Back to Calif or staying on the east coast? Congratulations on a fine and dandy trip.

2444. Riding wearing ARRL ARES vests

Yahoo group: BMHA
Date: 2010-11-11 03:16:06 UTC
From: BrassRat77
Topic: 2444 Message: 2444

I noticed the high-viz yellow Amateur Radio Emergency Communications vests (mesh & solid) at the ARRL site (http://www.arrl.org/shop/ARES-Deployment-Vest-Mesh/).

Anyone have one and can comment on how well they fit over a bike jersey and stay put while riding? How breathable is the mesh version? I'm thinking of ways to be more easily identifiable (besides the flagpole and water bottle mount antennas and HT on the handlebars) when doing ride support comms.

Steve -

I have seen these vests before and I know a few hams that have gotten them, they are nice and bright, personally, I've never worn worn one of the ARRL vests, but, have a Blue EMT vest with a star of life patch on the vest it works well for such events, even tho its blue and have 3m scothlite tape strips on the vest and can be seen for miles. I had bought mine off ebay a few years ago and still use this vest for radio support as well as for when I'm on the fire dept., as well.

73s's,

Jeff

Personally, I like the Amphipod Xinglet that I got earlier this year for riding and for when I am supporting an event ride. It's the reflective 360 degree bands that can be put over any shirt or jacket. I've seen them as low as $20 on line.

http://www.amphipod.com/products/visibility/reflective-vests/xinglet

2447. Dayton Hamvention BMHA Forum Speaker

Yahoo group: BMHA
Date: 2010-11-16 02:52:46 UTC
From: Mike
Topic: 2447 Message: 2447

Although I haven't heard from the Dayton Hamvention, I anticipate BMHA will be granted a forum in 2011. Anyone who is interested in being a speaker or presenter, please contact me. If the stipend is the same as prior years, it will be a Hamvention pass and great parking space right next to the South entrance. The speaker pass allows you to gain entrance into the main exhibit halls an hour earlier than the general public, that in itself can be valuable if you like to visit with the big guys at the booths.

If I get too many speakers I will have to draw straws although that has not happened in past years !

73-Mike, NF0N
BMHA Secretary/Treasurer

I would like to talk to the captive audience about two of our hobbies
Bicycling and Ham radio as they give us the opportunity to be merit
badge counselors to the scouts of America. I could even bring a few
pictures of both the National Jamboree and the local Camporee at which
we operated demonstration stations showing amateur radio including
Bicycle Mobile.
Another way to possibly bring some new members into amateur radio.
I will probably be at the Scout Booth in the ARRL area again this year also.

Good idea Bill. With the popularity of Facebook, it only makes since to have a presence.

If others agree, I could look in to creating an account. But if someone wants to set it up, please do.

I am certainly not a Facebook guru.

My wife and I find it a good way to keep up with what our children and grandchildren are doing.

Plus more and more organizations that interest us are showing up on Facebook

Hello group,
I am a bicyclist without a car who is planning on taking a good ride next summer to see the country and visit friends and relatives. I also have been interested in Ham Radio for years but have never gotten around to getting a licence or equipment. I was talking to my dad and he said I should be a ham operator from my bicycle on this trip. So I googled it and came up with some stuff including this group. My questions are, what equipment would you all suggest for a bicycle ham operator with a limited budget and can make things, and is there anyone on here from around Buffalo NY I could get together with and talk to.
Thanks
Tucker

A lot depends on what you want to accomplish with the radio while on the trip.

An inexpensive way to get started is to get a 2 meter handheld (with a couple of extra batteries and a quick charger) with a decent antenna and carry a copy of the ARRL repeater guide. This will allow you to connect with locals as you ride through their area as well as be able to connect to IRLP or Echo Link nodes if you want to make longer distance connections. The extra batteries come in handy for keeping the radio on all day while riding (my wife uses our Icom D90A on her bike when she does her century and event rides, like the Tour de Cure and Bike MS and two batteries allows her to keep the radio on for 12 or more hours) and the quick charger recharges the batteries in a couple of hours each. Also, with running 2 meter or 70 centimeter you'll only need to get your Technician license to start with.

Thanks for the reply. What material would you recommend for studying for the exam. I was looking at purchasing the Ham Radio License Manual Revised 2nd Edition sold by ARRL but was open to a cheaper or better options. The local library has the book which covers up the 2010. How much of a problem is it to use a slightly outdated book?

Is there a good handheld radio that you would suggest?

How much experience do you have with electronics, radio and computers? If you have a decent level of experience working with these things then you probably have enough knowledge to get your technician license without too much study.

I, personally, am a classroom type person, self study doesn't work well for me with some things. Check your local HAM clubs to see if/when they are offering classes. In most cases the classes are free (the first class I took was at a Jr. College and we had to pay the school's management fees but the course itself was free) other than the materials you use.

Once I got ready to take the test I started doing the practice tests on qrz.com (http://www.qrz.com/p/testing.pl)

The choice of a radio is a relatively personal thing... I really like our Icom D90a but I'd love to get one of the new Yaseu VX8GR so that when my wife is riding her bike I can track her while doing SAG... but $350 for a handheld is a bit more than most folks would want to spend on a first radio...

Alinco has a decent 2 Meter handheld for under $90 (http://www.universal-radio.com/catalog/ht/4175.html) and it has a high capacity add on battery available as well as a bunch of mic/earphone options and programming cable/software options...

Hi Tucker,

First, welcome to the group! I'm fairly new at this bicycling with
radio thing as well and thought I could share a bit of info with you.

First of all, as far as getting your license is concerned, I have put
some tips up on my wiki at:

http://wiki.complete.org/GettingStartedWithAmateurRadio

I passed my tech and general back in July, and my Extra this fall, so
I did a fair bit of studying this year and thought I'd document what
worked well for me. It may or may not also work well for you.

I asked here for some tips back when I was getting started. I
collected them in a more-or-less organized fashion at:

http://wiki.complete.org/BicycleMobileAmateurRadio

That page also has some of the notes I collected prior to joining this
group, and links to some other websites I found.

These are mostly from this thread:

http://groups.yahoo.com/group/BMHA/message/2428

I've been doing it a little bit now, and have the following feedback
to offer:

* 5W with a simple antenna can do amazingly well reaching about 40
miles away in flat areas of Kansas.

* The Pryme SPM-400D is something I'm not entirely happy with. There
are too many cables to connect/disconnect when I get on/off, and it

hurts my ear after being on it for awhile.

* The Arkon SM327 is the only mount I could find. It is... OK. I found that if I hit a rut on my dirt road, the radio fell out once, but I squeeze the clips tighter now and it's OK so far that way.

Hope this helps,

-- John

Thanks guys. Any info is good cause I just started getting serious about ham radio very recently and know almost nothing about radios, antennas and such. I do know a bit about electricity though and can pass those practice Technician exams with guessing on frequency and FCC stuff, which I don't have a clue about. I try to get a study book soon and learn what I am lacking in.
Thanks again and take care,
Tucker

Tucker,

I forgot one that I am using to help train myself for the General class on line and it tracks your score as you go also:
http://hamexam.org/

You'll have two ways to test yourself there: with flashcard type screens where one question is asked and you answer with the previous question below it that you had and full Practice exams that get graded.

You'll have to register there but I have found it worth the few minutes to fill out the registration form so far.

Hope everything that I have suggested helps you out in some way.

Here's the guide that is used locally here for our Tech in a day classes that is suppossed to be studied BEFORE anyone attends the class. KB6NU and teaching crew have had nearly a 96% rate of attendees that take the Technician exam that is offered after the class over the past couple of years.

There are two versions available: Technician and General class

You can download them here:
http://kb6nu.com/tech-manual/

The Technician is also available as an e-book also now:
http://kb6nu.com/e-book-version-of-the-tech-study-guide-now-available/

If these do help out, PLEASE let KB6NU, Dan, know about it as he is also interested in feedback on these downloads.

From: mchenryproj
Topic: 2269 Message: 2472

What antenna did you go with for the 2010 riding season? I am looking at the MP-1 as well as either single band Maldol types or maybe some sort of jumpered arrangement. Something not too long but long enough is good for me. Most of the trails are pretty open but some of the rails to trails here in Ohio are a bit overgrown with smaller low trees, and there is an occasional tunnel in the area too.

I think the 12" base MP-1 sounds like a winner for me. Using it with an 817 this 2011 riding season.

Do you have a carbon frame bike or a metal/steel/aluminum frame bike...

On my wife's bike, carbon frame, we use a Maldol AS30 (15" Dual Band) velco strapped to the seat tube with a thin coax lead back to the handle bar where the radio is mounted.

On my bike (aluminum frame) we use the Maldol MH511 (4.5") right on the radio.

Others here, with metal frame bikes, have used mounts fitted to racks bolted to the bike with antennas up to a 5/8th wave size.

I run a recumbent stuck a rack on the back and use a homebrew 1/2 coax antenna for 2/440 and a hustler for HF.

The top of a MP1 is a typical hollow telescoping whip and won't handle trees well. I'd use something more flexible on the top. A fixed length whip will make tuning more touchy but will work well.

Sean, for the VA QSO party station, I used a modified MP1: longer base rod, the MP1 coil, a 10' or 12' telescoping MFJ whip, and the MP-1 counterpoise wires. Antenna mount is a 3/8" threaded bolted to a rear rack. The bike frame (steel, Bianchi Castro Valley) serves as an additional ground. This set up is good for stationary/portable, it is too flimsy for in-motion. I used coil adjustments for rough tuning and a Elecraft T-1 for fine SWR matching. 40M wound up being my workhorse band. If I get a chance before the 2011 QSO party, I want to play with elevating the ground wires to see if that improves performance.

For in-motion, I used the same or a shorter base rod and a 3' whip salvaged from a 2M antenna. I theory it'll tune 40M, but 20M or 17M may be the lowest practical band because of the small radiator size and poorer ground system. Pics of the setup are in the photos area: http://groups.yahoo.com/group/BMHA/photos/album/1949487468/pic/list

Single-band hamsticks, plug-tappable, and Hustler loading coil arrangements would also work. I don't want to carry multiple hamsticks and already had the MP1. A buddistick would also work. All you really need is the tappable or adjustable coil (or fixed coils for each band of interest) and a long enough radiator.

See what you have available and give it a try.
73 & Happy New Year.
Steve KS1G

2477. Request for advice

Yahoo group: BMHA
Date: 2011-01-04 05:07:10 UTC
From: Al Gritzmacher
Topic: 2477 Message: 2477

I can think of no better group for expertise in this area ;-) so I'm going to ask a couple questions and see if anyone has any ideas for me...

I'm planning on doing some long-distance touring this summer. I'm thinking of doing a 1-2 week trip as a shake-down cruise, so you can see by long, I mean l o n g ...

I'll be riding my TerraTrike Tour recumbent trike and pulling a trailer. I don't plan on HF mobile, but will save that for the campgrounds. I would like to be ready for VHF/UHF while mobile including APRS.

I'd also like to incorporate solar power into the package.

So, those are two areas I'd like advice on, especially from those who have done it before. I searched the newsletter archives for solar power information and found a little bit of information.

APRS: I have ordered a Kenwood TH-D72A handleld with GPS and TNC built in. I will have a netbook with me for programming and use while stopped. I'm interested in hearing about what the current state-of-the-art software for packet is. I used to be pretty up on packet, but got out of it for probably 10 years or so. What I've seen on the web is such a mixed bag of either old, outdated pages, or incomprehensible pages that jump right into the minute details without so much as a nutshell explanation of the software. If someone could point me in the right direction in that regard, it would be great.

Solar: I picked up a 15 watt panel and charge controller and plan to mount it on the trailer. I have a trailer coming that is similar to a BOB trailer, but two-wheeled. I felt that would be more stable with a solar panel on it. I'll pick up a SLA battery at some point to work with it. My plan is to have the battery, panel and most of the electronics in the trailer, but run a wire up to the bike to power the HT and various other accessories. I might possibly put a small SLA battery on the bike as well. I might use it for lights, as well as for times when I unhook the trailer. I'll be charging the netbook, a cellphone, the HT and rechargeable AA batteries for various items off the solar power system as well as operating HF when camped. (Elecraft K2)Any ideas or tips regarding the solar power would be appreciated as well, especially things I may not have anticipated.

If all goes well with my short shake-down trip, I hope to go cross-country for up to several months.

A few details more are posted on my blog at gritzmacher.net and I'll be updating that as I go.

Thanks for any advice. 73,

Al AE2T

Hi Al,
Sounds quite ambitious. You'll need to give us some more info about
your power requirements, planned (if any) battery size, etc, for us to give
you more input on that segment of your project.

Best for now,
Joe N1KHB

Al, AE2T,

In my humble opinion you're taking too much stuff.

A KX1 with dry cells will fit in your pocket while you shop for groceries. Libraries will allow you access to their computers. Or, you can log your trip with pencil and paper and mail it home to Aunt Bertha.

Best of luck,

72 de Scott/n7net/qrp

Al,
I understand the mental gymnastics you are going through. I went through the same in preparation for my TransAm.

I considered going with solar but I was concerned about the abuse that it would see. Your bike will hit the ground several times throughout your trip. Hopefully without you on it. Anything that you mount on your bike had better be rugged enough to take your bike falling over.

I chose to use a radio harness rather than mount my radio to my bike. The comet SMA-24 antenna worked adequately for my purposes.

For power I chose to take three batteries and a rapid charger for my HT. on only one occasion did I deplete all three batteries. Since you are running APRS your duty cycle might be higher.

Usually I was able to find AC power within feet of where I Camped.

The only state I had trouble with charging batteries was KY.

If I were to design a self contained charging set up my choice would be to use a dynamo hub and a charge controller to charge NIMH batteries. SLAs are very sensitive to over-discharging.

Good plan on the shake down cruse. Where are you going to ride?

Steve Roberts is still going strong.

He's gone through three (I think) versions of bikes, a catamaran and is getting ready to take off in a large, steel-hulled sailboat.

I looked back through some of his web pages as I contemplated this project and even contacted him on Facebook. (facebook.com/nomadness)

I met Steve at Dayton once and have an autographed copy of his first book!

Dean,

Thanks for the input.

If I were only carrying a HT, I'd agree. Actually, I don't know how much talking I'll do on it anyway. VHF/UHF/repeater operating is pretty been-there-done-that for me. It's an option, though and may come in handy.

But my main interest in it is for packet/APRS tracking. For that, the radio can stay in a bag. I'll put a bigger/better antenna on somewhere for some gain. I ordered a Kenwood TH-D72A, which arrived today and I'm learning how to use it. That'll take me a while!

As for tipping over, yes that could happen. But remember, it's a tadpole trike and a two-wheeled trailer. It's not going to happen often! The trailer also arrived today and so far I've been impressed with it's quality.

There will be opportunities for charging things off of AC mains, so I'm not concerned with being 100% solar powered, but it will be nice to have some available. The list of things is far more than a HT. I'll be powering a smartphone (HTC Incredible), a Netbook, the Kenwood, and want to be able to charge AA batteries for a camera and bike lights. And ocasionally run the K2 while camping.

It should be interesting. Probably a source of many gotchas and "learning experiences" and maybe even an article for a BMHA Newsletter...

I'm leaning towards a spring trip to and back from Washington DC as a first run. I have relatives in DC that I've promised to visit for years. It will be a combination of ACA routes from Buffalo to Pittsburgh, then the GAP and C&O trails thanks to a suggestion from the BMHA Facebook group. After that, I should know whether it's worth the effort to carry everything.

Thanks for the input and I look forward to it all...

73,

Al AE2T

I have an Incredible. Depending on how much web surfing and typing you want to engage in, it may be a good enough substitute for the netbook that you can leave the netbook home. The android phones seem to be battery hogs. I found and ordered plans and a parts kit for a "Mintyboost"; basically a battery pack and USB connector fit into an Altoids tin for recharging USB devices - such as a smartphone. Could probably be adapted to use a bike generator or solar-power.

A terminal program on the phone may be good enough for use with the Kenwood that you won't need a netbook for packet or APRS. Also look at APRSDroid for software. You are more likely to have access to the phone network in/near towns than an open wifi for the netbook.

That is a great shakedown trip. My neighbor used GAP + C&O as part of her prep for the Transamerica (VA Beach -> Oregon) ride last summer. Depending on how much rain you get, mud may make the C&O on a trike+2-wheel trailer "interesting". Yahoo groups has a coTowpath group and a GAP group - excellent sources of current info on trail conditions and services.

> group. After that, I should know whether it's worth the effort to carry
> everything.

On taking HF & VHF gear on the C&O (did this a few years ago on Boy Scout trips): You're in the Potomac River gorge - there may be a few sections (more towards the Cumberland) where HF and VHF may not get out too well. If you plan to use the hike & bike sites on the C&O, they do not have AC power (some of the larger ones, like Antietam Creek, may have AC at the latrine building). Plan to use CW with earphones or a data mode at night - I tried it with SSB for one evening and was QUICKLY informed my voice carried! I think I made 2 HF QSOs over the entire trip. Was not worth the weight/volume IMO for my limited operating time. My FT817, MP-1 vertical with a MFJ 10' telescoping whip, and SSB worked but was not optimal (or nightime campsite friendly!). If I was doing again, would consider a smaller backapacker rig: KX1, TenTec QRP CW rigs or their Chinese versions, maybe one of the Altoids-size single-band QRP rigs, with wire for an inverted-L, balance-fed dipole, maybe go end-fed. And improve my CW skill.

My HT came in handy the last night of the trip (we were midway between White's Ferry & Great Falls). WX band reception and the local Skywarn net kept us fully informed of thunderstorms moving through the area. If I had APRS with me, I would have tried a simple "At <H&B site name/mile marker> having a great time" Btext each evening and seen how easily the families back home could follow us using one of the APRS web sites.

The eastern sections of the C&O are well within coverage of western metro DC repeaters and APRS relays. I would definitely bring a roll-up jpole and some string to suspend it from a tree. A jpole mounted on a bike flag makes IMO a great VHF bike antenna.

Not directly related to ham radio or cycling but IMPORTANT if you like ice cream: Be sure to stop @ Nutter's in Sharpsburg. You're welcome. :)

Hope this helps. 73, Steve KS1G

In My Humble Opinion, I LIKE my "Stuff", and lots of it.
Even commuting part way across town daily I carry a spare tire tube, tools, snacks, water bottle, external NiCad pack to run my TH-D7 / GPS combination... which does indeed load me down and slow me down.
I do like to "Be Prepared", and usually the only time I really need some of these odds and ends is when I don't have them with me for some reason. I consider the extra weight and loss of speed well worth the convenience of being able to be more self sufficient when things go wrong... and have toys to play with along the way.
I use an Acer 9" diagonal screen netbook, which is small and light and has close to 6 hours of battery life and will fit in almost any pack or pannier. It also has a super-range wifi that can connect to hotspots almost twice as far distant as any other system I have. The battery will charge slowly and the netbook will run on straight 12 VDC, which comes in handy in such a mobile setup.
I loaned a hinged solar panel (approx 18" X 24" opened up) to a cross country quint-cycle family this summer and it kept their system working fine and charged all the way from NM to northern CA. They never used it for voice, just APRS only. The system might have made it to Alaska with them but they experienced a fire in their bike trailer that consumed the entire trailer contents along with the solar panel which was bungee'd on top of a sleeping bag roll on top of the luggage. It appears upon subsequent questioning and thought that the homebrew Nicad pack chafed through the insulation separating the 10 individual cells and shorted out, sparking a fire that quickly set off a small propane bottle adjacent to the battery/radio pack.
Since then I've tried to make sure my home brew Nicad and NiMh packs (10 AA cells in series, taped together in a pack) have extra sleeving between cells.

I don't know who was asking about a bike trailer, but here's another option.

http://www.bikerev.com/

Ian is an individual who's been building trailers for many years. I remember a trailer he built for hauling a canoe behind a bike. It won't cost you anything to tell him what you are trying to do.

There's no association between us. I live in McKinney, Texas, he lives in Eugene, Oregon.

From: n7net
Topic: 2491 Message: 2491

Two years ago, naybe 3, I toured some of Idaho on a Bike Friday with a BikeRev Trailer. In photos, in N7NET's Stuff you can see how heavy I was. I did stationary HF 40m CW QRP with a MFJ-9040, 8 AA batteries, and a wire and VHF simplex on the move.

You are right they are hard on the battery. And I almost could get along
with it as a substitute for the netbook. I've seen the Mintyboost too,
but it seemed a bit of a kludge for daily use. Might be just the thing
for on the bike, though.

That would be a neat idea. Aside from the cabling issue - male to male -
can the USB connector on it be used that way? I'll ask my son. He's a
bit of an Android phone expert. I have a terminal app already, but only
use it over the net.

I'm already playing with APRSDroid, as well. I can tether the phone to
the laptop for access if I can't find wi-fi, although email and web use
is entirely adequate on the phone.

The KX-1 is nice, but I don't have one. I've got a SW-40, a NC-20 and a
MFJ 30m rig, but if I took all them, I'd have as much weight as the K2
and twice the clutter. I never make a lot of HF QSOs when camping, but
it's nice when I do get on the air. A light dipole or EFHW should do for
the antenna.

A J-pole on the bike flag is at the top of my to-do list! The J-pole and I are no strangers and I've used one on a bike in the past.

Thanks for the great comments. There have been several useful answers today here.

Thanks for that link. It's not a lot different than what I may end up with. Although the trailer I bought (arrived yesterday.) is set up for a bag like the BOB trailers, I'm thinking the plastic bin is the way to go. Been eyeing some at Wally-World, just waiting for actual measurements before I buy.

Has anyone thought of just taking one of their old kiddie tote-along behind trailers and stripping it down and using that instead once the kids are old enough to get around on their own?

I also would like to know if anyone remembers a ham, I think his name was Steve, that was traveling the country on one of those three wheel trikes that the seniors use for riding around their trailer parks in Florida? He was in the Tampa/St. Petersburg area in the mid 90s and I haven't heard about him since then.

2496. Re: [BMHA] Re: Advice for bike/trailer

Yahoo group: BMHA
Date: 2011-01-07 16:05:40 UTC
From: Jay
Topic: 2480 Message: 2496

The trailer I pulled during my east coast cycle trip from Canada/Maine border to Key West Florida trip in 2002, was just this, a modified kiddie trailer. Wide and stable. 20W of solar was mounted to the "roof" feeding a pair of SLA 8ahr batteries, one in the trailer, one on the bike. (That way I could dump the trailer and still have power for my gear).

The problem with the kiddie trailers is that they can get real heavy fast, due to the amount of space that they have. Mine, when loaded, was about 45#, getting pulled by the RANS Velocity2 recumbent. REAL tough on the uphills, but crazy fast on the other side. :-)

Being two wheels "wide" cars and trucks gave you plenty of space, plus I think most cars that there were kids in it. ;-)

My ham gear consisted of a Kenwood D7a for aprs / repeaters/sats/.52 traffic (mounted on the handlebars with a throat mic) with a Garmin vista next to it, and a Yaesu 817 that lived in the trailer. I also had a laptop and a cellphone. (2002 trip). 1/2 wave dual band vhf/uhf on the bike rack behind me and a ham stick that I mounted on the trailer (which doubled as a flag pole).

I quickly found out that the 20W solar system was NOT nearly enough power to charge everything. The laptops are power killers. Add in several days of tree cover, cloud cover, rain, etc.. and you could have several days in a row without "charge" ability.

What ever you go with, OVER engineer the system with wiring, connections, and mounts.

I know we all have the best intentions to be nice to our equipment. Trust me:
Your gear is GOING to get wet.
It is GOING to get hot.
It is GOING to fall on the ground.
It is GOING to get covered in road dust, salts.
It is going to get jarred REALLY HARD when hitting potholes that you can't avoid due to a car RIGHT next to you. (Doesn't that always happen?)

Planning for this will ensure that the equipment will last.

If I was to do it again, I would ditch the laptop/netbook for the Android / iPhone and use that exclusively.
Lower battery requirements, longer life, multi-purpose, and lighter, plus one less thing to worry about when you get caught in that rainstorm with no where to go for at least 3 - 5 minutes.

You can log stuff either online or use evernote to sync back to a computer at home.

Sounds like a fun trip!

Has anyone thought of just taking one of their old kiddie tote-along behind trailers and stripping it down and using that instead once the kids are old enough to get around on their own?

I also would like to know if anyone remembers a ham, I think his name was Steve, that was traveling the country on one of those three wheel trikes that the seniors use for riding around their trailer parks in Florida? He was in the Tampa/St. Petersburg area in the mid 90s and I haven't heard about him since then.

Barb and I pulled the BikeRev trailer shown in N7NET's Stuff behind a Burley Samba Tandem. A rain storm hit us on the trip south toward Williams. Construction crews were repairing the road surface with a red volcanic ash and it got mixed in with the road spray caused by the speeding tour busses that roared past us. By the time we reached Williams we and everything we owned was a rusty red color.

I can't say it was a lot of fun that day, but we sure made a memory.

Bring enough sealing plastic bags to protect your radios and whatnot from Mother Nature.

As you can see from the link, and from those of us old enough to remember reading Steve N4RVE's articles from those days, it was hardly a "senior three-wheel trike". It was in fact a custom built recumbent 2-wheel bicycle, the likes of which no one else has ever seen and likely never will again (unless Steve brings his to your area for a demonstration / talk). It was so exotic and far fetched that it wasn't the type of project that inspired others to do likewise. It was more like a daily log of a trip to another planet with impossible-to-obtain gear: Interesting reading to be sure but impossible for us mere mortals with real-world jobs and incomes to imitate.
I'm just sayin' ......

I probably have the name wrong as it certianly was not the BEHEMOTH or the Winnebiko. Those I would have remembered seeing.

This ham was on an actual three wheel trike that seniors use in retirement. I do remember that much...:) He wasn't loaded with radios either. Some 2m FM and 6m all-mode (which got me interested in 6m then) plus an HF radio, none of which I can remember models or brands. Plus he had no trailer either.

This would have been in roughly the 1992 or 1993 time frame as I had just recently gotten licensed in late 1991 as KD4DLA then. He was around for a couple of months before he set back out to continue his trip.

Never heard much from or about him after that either. So I was just wondering if anyone else had met him or knew his current status.

I also remember Steve's adventures and it re-inspired me for a coast to coast jaunt as was a dream in my youth which I am yet to and will do but a couple of summers ago a friend of mine and I decided to ride around Lake Superior which is about 1400 miles and it took us 21 days. we carried everything with us (no sag wagon) and many times in Canada there was nothing for 30-40 miles around. This was like backpacking on a bike. I have backpacked a bit and used those experiences and knowledge for that trip. I also collected some money for the MS society. If anyone is interested I did a daily journal on my treo 650 and emailed it to my son for posting on my website. You can go to my website www.jarosh.org click on the daily journal link to read and see the posted pictures. In some of the pictures you can see the 5/8wave antenna on the back of the bike.

What I would REALLY like is a bike trailer that would become a shelter. That would be very convenient (although you would have to empty it first). Such things have been designed. Imagine having a platform with legs that folds out to the rear, and a tent covering the whole thing. Gear could be stored under the trailer for the night. Of course we we would incorporate a mast mount and solar panel roof.

I don't know who was asking about a bike trailer, but here's another option.

http://www.bikerev. com/

Ian is an individual who's been building trailers for many years. I remember a trailer he built for hauling a canoe behind a bike. It won't cost you anything to tell him what you are trying to do.

There's no association between us. I live in McKinney, Texas, he lives in Eugene, Oregon.

There are several bike trailer tents...

http://www.tonystrailers.com/nomad/

and

http://store.kamprite.com/catalog/Midget-Bushtrekka-p-16143.html

and for those of you who are really adventurous you can get the plans to build an ultra-light teardrop camper for your bike...

http://www.tinyhousedesign.com/2009/05/13/ultralight-teardrop-trailer-for-a-bicycle/

That reminds me - I saw a program not to long ago about bicycling and camping. I don't recall the name of the program, but, someone had built a trailer big enough to hall by bike and camp in a trailer being pulled by a bike.

Sheez, where did I see that? Kick in the 40 ages here... LOL.

I've seen stuff like this. In fact, I have an old kiddie trailer that I'm looking at doing something similar with using an Eureka Solitaire as the tent, and making a tri-fold platform on the trailer deck to hold it all up. The biggest concern is weight.

Actually, you wouldn't have to empty it first. If you made it a box trailer with a tri-fold lid so that you could fold it out, all you'd have to do is put the tent on the folded out top. Perhaps using an old tri-fold lawn chair as the basis for the deck to put the tent on. That would basically give you a covered cot to sleep on.

Again though, my biggest concern would be the tendency to go with "I have room for it, so I'll pack it!" and kill yourself with weight.

2508. Re: [BMHA] Re: Bike trailer/camper

Yahoo group: BMHA
Date: 2011-01-08 20:25:21 UTC
From: Philip Hahn
Topic: 2504 Message: 2508

Hi guys.

I've been thinking about touring at some point on my recumbent with a HF radio.

With four panniers and a bag on the rack, I don't see the need for a trailer. That is plenty of space for what I need. But I do have some ideas that might interest you.

What I was planning on doing for an antenna is getting a long fiberglass whip, about 12' in length, and securing it to the rack on my bike. I would use this as an antenna mast by attaching a thin wire. Then with a tuner and a small HF radio I'd be able to get on the air.

At night when I wanted to camp I'd park the bike (which has a kickstand) and bend the 12' rod backwards. A hinge on the rack might also help. I'd attach a rope with a stake to the end of the rod and stake it down as a lean-to, and cover with a tarp. This would serve as my tent. If long enough, it is possible I could bend it over the bike to cover both me and the bike, and operate radio at night.

Just a thought. I've done the kiddie trailer with kids and to move stuff around but I've always felt I handled better with a heavy bike versus a lighter bike and trailer.

Phil, KI4VUP.

2509. Memories of Earlier BMHA days.

Yahoo group: BMHA
Date: 2011-01-17 02:26:40 UTC
From: ka0soh
Topic: 2509 Message: 2509

During the summer of our nations' bicenttneial, 1976, I made my first cross country effort...not totally successful...but a ton of fun; and, these days, its comforting just to be able to say I tried to ride from one or more borders across the entire USA! Too much ambition for my own good, however. A popular book back in those days was Walking Acoss America, and it was my hope to accomplish the same thing on a bicycle.
I managed to ride from St. Louis, MO over to Denver, CO and then decided that I'd ride to Seattle, WA...just outside of Denver going north, my chain broke and that's where I found out all about alpine gearing and longer chains. Its also where I discovered that to change one's notion of a long ride wasn't against the rules. So, I rode back to St. Louis with the thought that eventually I'd wind up in Washington, DC. Never did happen. Got home, stretched out on the couch and enjoyed it. That's where I spent the next several years.
In 1976, I rode a Nishiki Safari, a wonderful Jap touring bike that was around in those days for about $400 and perfect for long distance rides. It came with all chromemoly frand, strong touring lights front and read, good panniers muonted on racks meant to face a long distance tour and alpine gearing. You could pull stumps out with this bicycle, according to some folks. Back then, the guy that owned Bicycle Mag had one and he rode his Safari around the world and editorialized/talked about it many times in his magazine enticing me to purchase one. I'd offer up the Nishki Safari was the best built, most complete, best thought out touring bike ever built, IMHO. With all its equipment, the bike weighed in at 36 lbs and after filling the panniers, etc...heavy bicycle. To compare, sitting in the garage waiting for short bursts around town and the local park, my Peugeot PX 10LE weighed in at 22lbs. So, mostly rode the lighter bike around the town.
Years later, I dedcided to ride the lighter Nishiki Competition, 25 lbs, across several states but not necessarily the entire USA!
I lasted from Columbus, OH to Salt Lake City, UT and gave up in abject humiliation. I returnded to the couch and ham radio. That same summer, I met Hartley and the guy had an infectious personality. He roped me in and before I knew it I was acting as NCS and check-in observer on HF. My weak antenna system wasn't enough to meet the needs of the net, however and I decided to listen was the better thing. After 1991 Dayton Hamvention, I returned home and, following the very creative instructions of many of our hamming members in BMHA, opened up a remote HF network from my Safari and 440ht set up on the bike. So, for awhile, I could ride my bike on a Century run and still work HF around the world. It was one of the first set ups like this in the nation, as a matter of fact. As far as I am aware, however, the network had no other bicycle hobbyists but for me. It all was a lot of fun. Nowadays, we seem more to follow the cell phone and for many this would seem to be more of an advantage. I still miss the mystique of radio.
Again, its just great to see the BMHA still pushing forward and I have to commend all the numerous volunteers that've put in the time to keep the club up and running. Very best,
Donn, KA0SOH

Wow,
Are there any pictures of the burned out trailer?
If you can get them could you post them.

> Even commuting part way across town daily I carry a spare tire tube, tools, snacks, water bottle, external NiCad pack to run my TH-D7 / GPS combination... which does indeed load me down and slow me down.
> I do like to "Be Prepared", and usually the only time I really need some of these odds and ends is when I don't have them with me for some reason. I consider the extra weight and loss of speed well worth the convenience of being able to be more self sufficient when things go wrong... and have toys to play with along the way.
> I use an Acer 9" diagonal screen netbook, which is small and light and has close to 6 hours of battery life and will fit in almost any pack or pannier. It also has a super-range wifi that can connect to hotspots almost twice as far distant as any other system I have. The battery will charge slowly and the netbook will run on straight 12 VDC, which comes in handy in such a mobile setup.
> I loaned a hinged solar panel (approx 18" X 24" opened up) to a cross country quint-cycle family this summer and it kept their system working fine and charged all the way from NM to northern CA. They never used it for voice, just APRS only. The system might have made it to Alaska with them but they experienced a fire in their bike trailer that consumed the entire trailer contents along with the solar panel which was bungee'd on top of a sleeping bag roll on top of the luggage. It appears upon subsequent questioning and thought that the homebrew Nicad pack chafed through the insulation separating the 10 individual cells and shorted out, sparking a fire that quickly set off a small propane bottle adjacent to the battery/radio pack.
> Since then I've tried to make sure my home brew Nicad and NiMh packs (10 AA cells in series, taped together in a pack) have extra sleeving between cells.

I've uploaded the photos sent to me of the damage. See:
http://groups.yahoo.com/group/BMHA/files/W5AOX/
There are 4 pictures of the remains of a trailer full of stuff destroyed by a NiCad AA 12 Volt 10-cell pack that evidently shorted out from vibration cutting through the insulation sleeves separating the cells, igniting a nearby propane canister.

Last summer I was running APRS with a TT3 and powering everything with eight D cells. I hit a bump and then smelled smoke. The battery pack had somehow shorted. I managed to get everything on the gound before any damage was done to the bike. However, it did ruin my TT3 and my GPS receiver.

Donn,

Thanks for sharing your experience(s). There are some serious grades west of Denver. That's where you need that "stump puller" bike, hi.

Topic: 2479 Message: 2514

As I recall the story, the quint-bike family had just stopped for the evening and were setting up their tent for the night when the Mom heard some faint "popping noises" and within a few seconds one of the girls started screaming "The Trailer's on Fire!!!" By the time Mom & Dad arrived at the scene the trailer was billowing smoke and flame and it was too dangerous to try getting anything out. There were probably 2 or 3 small disposable propane cylinders in the bundles of stuff. It's likely someone jostled the APRS battery pack (which was inside a small leatherette pouch) and 2 of the AA cells shorted together. As you can see there is nothing recognizable left in the smoldering ashes. The loss included a 10 watt solar panel, IC-2AT transceiver, Globalsat BR-305 GPS puck, fiberglass J Pole, and the TT3 tinytracker.
I have experienced NiCd packs shorting before. They can blow a lot of smoke almost instantly and I've seen the connecting wires / tabs between cells melt and separate like a fuse, but thankfully I've never had to put out a fire (though I've had blisters on my pinkies from trying to pull them apart while smoke is billowing).
Their last gasp position report still shows on aprs.fi:
http://aprs.fi/?call=peduin&mt=roadmap&z=11&timerange=3600
They got another donated trailer, restocked with travel supplies, and a local REI store gave them a tracking device that recorded the remainder of their trip to Fairbanks, Alaska. See http://www.pedouins.org/ for their complete journey from TN to AK on a 5-place bicycle.

2515. BMHA Dayton Hamvention Forum Announcement

Yahoo group: BMHA
Date: 2011-02-04 15:03:04 UTC
From: Mike
Topic: 2515 Message: 2515

The 21st annual BMHA forum is set for Sunday, May 22nd at 9:00am. Mike Nickolaus, NF0N, is our forum moderator again this year.

Anyone who would like to present at the forum will receive a Hamvention pass and a parking spot next to the arena. Please contact me if you would like to volunteer.

We are encouraging anyone to bring their setup and display at the Forum. We will set aside a portion of the forum time for attendees to roam the room and ask questions, take pictures and learn about how others have setup their bikes with VHF/HF gear and antenna systems. If anyone would like to present pictures or audio, we will have the necessary viewing equipment available. Bring your CD/DVD or presentations on removable media. Computer equipment will be supplied.

Please see the BMHA website: www.bmha-hams.org for more details as they become available.

Mike, NF0N
BMHA Forum Moderator

One last plea for anyone who would like to be a speaker at this years Dayton forum. If I don't get anyone who would like to speak, you will have to listen to me again talk about one of my trips. That's OK but don't complain that it isn't interesting !! I do have a few topics that I can talk about though.

If interested, please contact me as I have to get the program list by March 15th.

Did you forget that I offered to talk about the synergism of Amateur Radio and Bicycles with Boy Scouts of America and the merit badges for those topics? Hopefully I can even get a Scouter from our group that staffs the BSA Booth in the ARRL area to join me.

Norm,

Yes I have you as one our main speakers. I was hoping we could get at least one more speaker as this year we have 1 1/2 hours of time. Right now it is just you and myself as speakers. If we don't get any more, we will open it up for those who might want to show or talk about a special project or we can make the rest of the time a time to just visit with all the BMHA attendees.

I will also have more of the Adventure Cycling special edition magazines along with 10 free memberships.

Mike

From: n7net
Topic: 2520 Message: 2520

It's a work in progress with a MFJ-9420 and a ham stick tuned so there's no need for a tuner. It generates about 9 watts and I've reached out 1700 miles so far. Still more work, but it has the smell of promise.

See two photos.

2523. Yaesu ft 957D versus Icom IC 7000 for bicycle operation

Yahoo group: BMHA
Date: 2011-03-05 16:41:53 UTC
From: Mark Allyn
Topic: 2523 Message: 2523

Folks;

I am planning to go bicycle and camping mobile.

I plan to have an inverted vee on my bike (home brew using
fiberglass rods and transformer wire coiled around the rods);
one rod driven and one rod connected to the bike frame as ground.

With this, I hope to get on 20, 15, and 10; maybee with luck on
forty.

For power, I am thinking of a 13 volt 14 amp hour NIMH pack
connected to either a 20 or 30 watt solar panel.

I am looking at two miniature rigs; the Icon IC 7000 and the Yaesu
FT 857D.

I am nudging tward the 857d because of two major things; the current
draw on the IC 7000 and allegations that the IC 7000's connectors
on the rear apron being very fragile and next to impossible to repair.

What gives me hesitation on the 857d are the few allegations that the
receiver is poor and that the radio is 'grossly non weatherized'.

I plan to mount the radio in a home made leather pouch (yes I do
sewing, along with other hobbies) on the handlebars. It will have
a detachable flexible clear plastic cover for the rain, however it
will be impossible to keep completely dry.

I would like to hear back from anyone who has experience with either
of the two radios.

Also, I would like to hear back from anyone who thinks that I am crazy.

Thanks you

Mark,

Perhaps you should experiment with the solar panel, battery, and radio prior to departure. A 12-volt panel may not fully charge your battery and it would be to your advantage to know how long you can operate before the battery drops below threshold value. Don't try to operate the radio without the battery in the circuit. Without the battery as a load the panel may damage your radio.

I would take first quality zip lock bags to protect your electric stuff from the elements.

Good luck and keep it fun.

Scott and the group:

Thanks for reminding me about the solar panel and the battery.

I have decided to look at the 14.4 volt batteries (NIMH and LIpoly).

I am guessing that I would need the 10 amp hour or maybe the 14 amp hour.

My space would limit me to a 10 or maybe a 15 watt solar panel for
the back. **Maybe** another solar panel for the front.

Looking at the solar panels, they say they put out as much as 15 to 16
volts or so at no load, which should be at least enough to trickle charge
whatever battery I decide.

Some folks claim that I would need to be careful having a solar panel
connected to a NIMH pack and left unattended.

Any comments? LIpoly is more expensive but seems to have the better
power to weight. Any other disadvantaages I should be aware of?

Truly,

Mark,

After retiring in 1999 I moved from Eugene, Oregon to the Arizona desert and fabricated a solar-powered station. I had 300-watts in panels and eight 6-volt deepcycle batteried wired as four 12-volt. I was never able to achieve a full charge, never more than about 11.8 volts. They say you can wire two 12-volt panels and go to a contoller with 24-volt and get a full charge, but I've never done that.

If I were heading out on a bike here's what I'd do. I'd stay with CW and I'd choose one band, two if I'd build a KX1 and carry two hamsticks. Or I might build a Small Wonder, or a MFJ Cub for the single band of my choice. I'd carry one or two ham stick for that band(s). I'd tune the sticks to the center of that frequency (you can get the SWRs very close to 1:1 on both a 20 and 40 stick) before leaving home and forget the tuner. For power, I'd go to Radio Shack and buy two 4-battery D holders and wire them for 12 volts and take a fistful of D cells, even AAs, and not worry about panels and overcast days.

I'm 73 and I don't tour very far anymore. I've switched from my Bike Friday and trailer to a Sun trike and I've configured it in the manner described above. From Dallas I've had some respectable QSOs. Fifteen hundred miles is pretty common. Always QRP.

Scott:

Thank you for the suggestions. . .

I was not aware of the hamsticks; I will look into them.

Curretly, my biking consists of my 20 mile commute for work (Portland to Hillsboro). I would be using the rig primarily for that.

Since this is a two hour commute, and I can charge my battery off the mains both day and night, I would not have to worry about solars for my day to day use. It is camping and century rides for which I would consider solars.

Good idea of using two panels in series with a controller. That might work if I do decide to have one on each end of the bike and put them in series.

I was intending to try for SSB QRP on the bike; using a headset under the helmet so that I can stay hands-on-handlebars. I also plan to have a 2 meter whip for the local repeaters.

That is why I am considering one of the HF/VHF radios.

I am curious; how do you operate cw while riding the bicycle?

By the way, I have done extensive electrical work for both my bike and myself. I make lighted clothing in jewelry for art. I have some of my stuff on lin in my journal at www.allyn.com.

You need a charge controller for any type of battery, but it's especially vital for lithium cells: they tend to destroy themselves in spectacular fashion in response to overcharging. Good controllers include what's called a Maximum Power Point optimizer to adjust the load applied to the panel to wring the most power out of it.

Solar panel ratings tend to be, mmm, optimistic That "15 W panel" delivers 15 W in full sun, with the panel perpendicular to the light, at a temperature that might require active cooling. Real life doesn't work that way, particularly for panels mounted at odd angles on a mobile platform. I'd guesstimate 25% efficiency, at best.

If you put two panels in series and illuminate them differently, the shaded panel limits the output current. The net power output will be roughly what you'd get from the illuminated panel.

In order to put 10 Ah into a battery, the power source must provide somewhat energy more due to inefficiencies from panel to battery; let's call it 20% for a nice round 12 Ah. For a nominal 12 V battery, stuffing 12 Ah into it works out to 144 Wh (12 V x 12 Ah). That requires nearly 10 hours of optimum noon-day sun... obviously not something you're going to get every day, although it'd make for nice riding!

Mobile radios draw a surprisingly high idle current; I think my FT857 runs around 250 mA. An all-day ride would draw 2 Ah from the battery, assuming you didn't do much talking. Recharging 2.5 Ah would require 30 Wh of energy: 2 hours of optimum noon-day sun. In real life, I doubt you'd get that much energy from the panels during a full day.

Solar power seems wonderful until you run the numbers. Then you discover how dilute those golden rays really are!

I'm impressed with your lights.

CW on the move is difficult for me. MFJ sells a minature paddle that might work, but I generally stop for a CW QSO. There's too much information to retain. With a trike stopping is no big deal because I still have a place to set. I use an old Army leg key.

In years past my YL and I rode a Burley tandem bike and pulled a trailer. We've traveled much of the Willamette Valley, ridden Missouri's Katy Trail, crossed Arizona's Sonoran Desert, and visited Grand Canyon. The day the Iraq war started I began a trip from Why, Arizona to just short of El Paso on a Bike Friday.

On up hill grades I don't have enough wind to pedal and conduct a QSO at the same time.

Have you considered the K2 (150 ma on receive).
If you are ok with CW only then there are many rigs with 35 ma current draw on receive. (Sierra, K1,ATS,SW+) These would make a difference in the size of the battery you would need to carry.

Scott:

I am in SE portland (Division and 42nd) full commute is 22 miles each
way.

I do have the option of using the MAX light rail.

That is where a challege comes into play.

Whatever antenna I decide to use will have to come apart (most
likely screw-together 5 or 6 foot pieces) so that I can quickly
dissassemble it in order to take the bike onto the train.

Right now, for an antenna arrangement, I am thinking of a 'V' with
the bike at the center of the V.

\ /
\ o /
\ i /
0<>0

The rig would be mounted on the handlebars.

The antenna tuner and driven part of the antenna would
be in the back; the front whip woube be ground.

The back whip (the one driven), would have an adjustable
tuning coil in the center and it would have a small top hat.

I have neen looking at the GM3VLB scotial bandhopper
mobile multi band virtical.

Both whips would be in 5 foot sections; most likely fiberglass
with copper wires for the driven elements. The pieces would
screw together using brass or copper threaded sleeves. I
andticpipate either three or four (most likely three) sections
for each (meaning 15 foot whips in the front and back of the
'V'.

This way, I can unscrew the elements to take the bike on the train
and re-assemble when I get off.

>>> If I were heading out on a bike here's what I'd do. I'd stay with CW and I'd choose one band, two if I'd build a KX1 and carry two hamsticks. Or I might build a Small Wonder, or a MFJ Cub for the single band of my choice. I'd carry one or two ham stick for that band(s). I'd tune the sticks to the center of that frequency (you can get the SWRs very close to 1:1 on both a 20 and 40 stick) before leaving home and forget the tuner. For power, I'd go to Radio Shack and buy two 4-battery D holders and wire them for 12 volts and take a fistful of D cells, even AAs, and not worry about panels and overcast days.

From: Ed Nisley
Topic: 2523 Message: 2534

On Mon, 2011-03-07 at 11:59 +0000, BMHA@yahoogroups.com wrote:
> receive current is about .5 Amp

That's much too high for any battery you'd want / be able to lug around on a bike!

> dithering between the lithium polymar and NIMH batteries.

Cheap lithium batteries have a lower peak current for a given capacity than NiMH and NiMH has a lower peak current than NiCd. The receiver's idle current determines how long you can operate between recharges (it's drawing power all the time) and the transmitter's peak current determines the battery capacity (to get a high-enough peak current).

You can limit the peak current by transmitting at QRP power levels, but if you're doing that, then there's no point in using a mobile transceiver. Just get a low-current QRP transceiver and be done with it; you'll save enough money on solar panels and batteries to pay for the radio several times over.

> any bicycle hams ... who had lithium battery fires?

There's not much difference between a lithium battery fire and a NiMH battery fire. Some pix made the rounds here a while back, showing what happens to a bike trailer carrying a shorted NiMH pack. Not pretty.

In a related subject, vibration will raise its ugly head on long tours and regular commuting:

http://softsolder.com/2009/09/03/recumbent-bicycle-amateur-radio-antenna-self-disassembly/

http://softsolder.com/2009/07/10/commercial-mobile-antenna-mounts-on-a-recumbent-failures-thereof/

I'd vote for a smaller (and probably less expensive) radio in a good vibration-isolated mount. Lower current, lower weight, same output power, maybe a better receiver... what's not to like?

Mark:

I've done comms support for multiple century rides an HT, and limited bike-mobile SSB QRP ops with an FT817. I also have an 857 I use at home and for portable ops where power/weight isn't as important. My thoughts:

Definitely use a headset. I prefer ones where I can mount a PTT button on the handlebars next to the right brake lever so I don't have to move my hand if I need to stop. Look for mike booms with wind protection or plan to add it to minimize wind noise while operating in motion. Most states require one ear be clear to hear traffic sounds. My prefererence is for headsets that go over the head rather than rely on a single over ear mount to stay put. There have been several articles in QST and online on adapting bluetooth cell phone headsets; I tried it once I acquired a VX8 HT. No wires between me and the bike is wonderful. The headset battery life may not last 4 hours, however. Since the VX8 is weather-resistant, I don't worry about rain during the ride. The standard battery is plenty for several hours of mostly listening and a spare is relatively light and compact.

Bikes have a lot of vibration you'll see immediately if you use a whip mounted on the radio (Longer whips move in a nice representation of standing waves!). This is rough on the antenna connectors, so I prefer a bike-mounted antenna. I have had best results with a J-pole or coaxial dipole attatched to a bike flagpole. End-fed 1/2 waves like the Larsen and the copy Lakeview/hamsticks sells don't need a ground, and I have tried 5/8 and 1/4 wave whips with a counterpoise wire along the bike frame.

I have not attempted in-motion HF ops. When stationary, I have used a modified MP-1: longer base rod, stock coil, either the stock telescoping whip or an MFJ 10ft telescoping whip. Works much better, esp. on 40M, with the long whip. There are photos of this set up under my callsign in the photo section. In-motion, I'd use a flexible whip from an old VHF antenna; the telescoping whips cannot handle the flex. To load the bike on transit, I'd remove the top whip and velcro it to the bike. And maybe use a shorter base rod. Quick-release adaptors with 3/8x24 thread speed dissasembly. I think hamsticks would also work well. Check the HFPack group and website on Yahoo groups, too - they have some info on portable/mobile HF antennas, radios, power, etc.

I have a Heil Traveller boom headset I use with my 817; it has a separate PTT switch I can strap to the handlebar if I was going to use it in-motion. I believe it also works with the 857.

I have mounted my FT817 to the handlebars using a Minoura handlebar extender (see the photo album). An 857 would be too heavy for that mount (there are stronger ones that might work). I'd put the radio in a rack bag and remote mount the front plate to the handlebars. I think the 857 has a mode that drops output to 20W on battery power and you can set it to QRP level. I have used a pair of 7AH SLA batteries with the 857. As others have posted, watch the battery voltage (the 817 will operate off lower voltage batteries). I have never considered carrying that much gear for a century ride; especially as most of the ones I ride have plenty of hills.

Have fun assembling your station & operating!

I have not replied to this before. My 2M/440 setup was featured in an issue of the BMHA Newsletter (Feb 2008). I use a set of tri-bars with a fabric sling supported by bungee cord and a comet antenna mounted by a seat post mounted rack. have put a lot of miles with no adverse effects on the radio or GPS unit.
There is also additional information in that issue regarding hf communication from the bike.
My suggestion is to review the issues of the newsletters posted on the website or your DVD if you are a member. You will see what has been done and avoid reinventing the wheel.
73 and may the roads be downhill and the wind at your back.

2537. Re: [BMHA] Re: Yaesu ft 957D versus Icom IC 7000 for bicycle operation

Yahoo group: BMHA
Date: 2011-03-08 04:47:58 UTC
From: Mark Allyn
Topic: 2523 Message: 2537

Folks:

Thank you all for your suggestions.

What I have done is to come up with a proposal for my setup on a bicycle.

Since I have not yet bought *anything*, this arrangement is still able to be altered.

==========

My setup, I hope, will allow mostly listening to ssb while riding. I also will want to do some operation.

I have a 2 hour commute (southeast Portland to Hillsboro for your folks familiar with the Portland, Oregon area). I am hoping that I can use this time for QRP hamming as well as getting my exercise in for the day (I still need to lose weight, even after three years of cycling)

Because I desire to do phone ops while pedaling, I will be needing to use a suitable one-ear headset (law does not allow both ears to be covered).

RADIO:

The radio that I anticipate using will be the Yaesu FT 857D. I want the ability to do phone as well as VHF.

I am hedging toward that radio because the IC 7000 takes close to two amps for receive and has more features than I need.

Also, the IC 7000 has been acused of having fragile connectivity between the rear apron connectors and the circuit board.

I do want the ability to use more than 5 watts; although I plan to keep power as low as possible.

The radio will be mounted to the handlebar via a home made leather pouch or 'holster'. As I have industrial sewing capability, I should be able to figure an appropriate restraint for the radio.

BATTERY:

The battery that I am proposing is a 14.8 volt Polymer Li-Ion with 10 amp hour capacity. I need this voltage because the rig (FT 857D operates best with 14+ volts.

I feel that this provides the best power to weight for what I need. Both gell cell and NIMH would be heavier. Any comments on this?

I anticipate putting the battery in a home-made pouch (I have industrial sewing capability) under the top tube of the frame.

SOLAR:

Two solar panels, 10 watts each, mounted on bike. One would be mounted on the rear pannier, just ahead of the rear antenna and the other mounted on the fron pannier; just behand the front antenna.

I am guessing that since most of these panels are 12 volts, I will need to put the two of them in series and then feed the total (24 volts in direct sunlight) to a charge controller and then to the battery. I am guessing this is the case because the battery I want would be 14.8 volts in order to effectively power the radio.

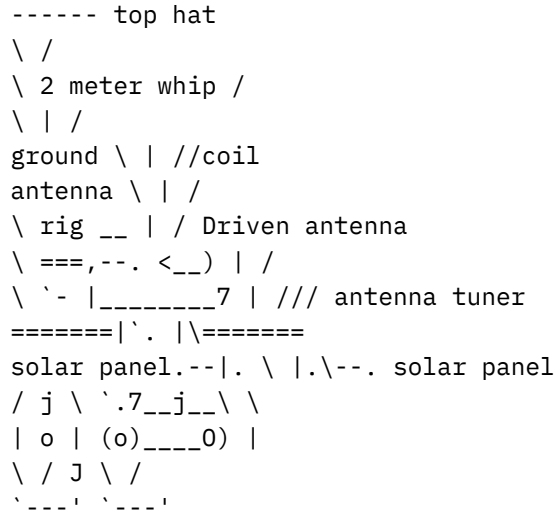
Perhaps, as one ham suggest that I do away with the charge controller; I might simply put the serial output of the panels directly into the lipoly battery . . .

Since Portland, Oregon weather is by no means sunny all the time, I anticipate that the output voltage will be lower than the stated 24 volts, but I hope I can maintain enough to at least provide some trickle into the battery.

Since a 10 watt panel is about 24 inches by 12 inches, this is about all of the power that I can accomodate on my bicycle's real estate. Any more would most likely mean that I would have to construct a vest out of flexible panels.

Am I reasonable? Or did I miss something about panels.

I have tig welding capability as well as a decent set of tools. I do metal art (you can look at some of my work on www.allyn.com). I feel that I should be able to make whatever metal fittings, brackets, etc for mounting the panels as well as the antennas.



ANTENNAS:

The configuration would be a 'v'. The antenna tuner and driven element is in the back. The front would be part of the ground plane.

Both sides of the V would be 15 feet (I hope), or 12 feet
(if 15 is not manageable)

The two rods would extend at about 14 degrees from horizontal.
Both antennas I am proposing would be in 5 foot 3/8th inch fiberglass
rods. Each rod will have threaded brass sleeves so that I can screw
them together.

The rods will have copper wire (the actual electrical antenna) glued
to the fiberglass them and soldered to the threaded sleeves.

This way, I can dissassemble the two antennas and be able to bring
the bicycle indoors or on board a bus/train.

I am proposing 3 pieces for each antenna; ie; so that each one would
be 15 feet long. If this proves to be too much, then I would do two
6 foot lengths for a total of 12 feet.

The back whip will have a loading coil in it's center as well as a small
top hat on the top end.

I propose to use a heavy clip lead to 'tune' the coil to the band.

My approach for the rear antenna design is simiar to that suggested by
the GM3VLB scotial bandhopper described on www.gm3vlb.com.

The front antanna would have a copper braid fastend to it's base. That
copper braid would be fastened to the front pannier rack, the bicycle
frame, and the rear pannier rack. This would form the ground for the
bicycle. It's not much, but I don't have much to offer with a bicycle.

I am hoping that the two 15 (or 12) foot rods, along with bicycle ground,
should be enough for 20, 15, and 10 meter operation, with perhaps limited
40 meter operation.

I am making an assumption that I would be useless on 75 and 160 with this
small rig. Any comments otherwise?

Mark,

   WOW! Sounds like quite a project.

I do a bike commute of 10 miles each way here in the Silicon Valley - back and forth to Tesla Motors each day(talk about batteries).

Your project sounds pretty cool - why don't you start with the battery, radio and antenna and add the solar panels later?

For me at commute times (early morning and late afternoon) the panels would not really do anything. Are you in the same situation? How about some panels at work that can charge the battery while you are working?

I would also say to try to get the battery CG as low as possible on the bike.

That's my 2 cents. I can't wait to see pictures!!

I haven't seen anyone mention the FT-817ND for bicycle mobile. It does 160 ~ 0.7 m and all modes. Five Watts QRP should take care of what you are after. If using the NiMH internal battery, the output is 2.5 W, but if you use the Alkaline AAs in the other battery holder, you should get close to 5 W.

Folks:

I am continuing to do research, especially in regards to the antenna and I would like to bounce something with you.

It seems that steel, stainless steel, and titaniums have a higher permeability than copper. This means that they will have higher resistive losses.

Based on this, I am making an assumption that a fiberglass rod, with insulated copper wire (of, say, 15 or 20 guage) glued to it would be better than either a stainless or titanium whip.

What I was originally thinkking was 1/4inch diameter titanium (in 5 or 6 foot sections which I can screw together). Titanium is lighter than stainless.

But with the permiability issue, this sounds like it's now out of consideration.

Am I at all thinking streight or did I miss someething?

Truly,

A hamstick requires no ground, separates into two (about) four-foot sections for easier stowing, and costs only about $20 each. They can be tuned to a center frequency at home and then leave the tuner at home. I've repeatedly talked 1500 miles on 20m ssb with nine watts using one. I've found they like SSB better than CW.

Mark,

One accessory I haven't seen mentioned is the MFJ 4416B Battery Voltge Booster <mailto:Booster@yahoogroups.com> (http://www.mfjenterprises.com/Product.php?productid=MFJ-4416B <http://www.mfjenterprises.com/Product.php?productid=MFJ-4416B>). It's obviously one more piece of equipment to carry, but it is worth its weight as it gives a steady sream of 13.8 volts output even as the batttery voltage input begins to decline.

Mark: I recall posts from the HFPack group folks using a simple 9' (108") whip - picked because it's available for full-size CB antennas - with an autotuner at the antenna base; fed using a counterpoise wire (pedestrian mobile) or the bike frame as ground. Mechanically simple and you get frequency-agile coverage on multiple bands. A single-band equivalent would use a loading coil somewhere (center or base); a big enough adjustable coil gets multi-band coverage. Think something like a PAC-12, MP-1, or Buddistick (commercial or the home-brew version). From 1st-hand experience, I can say the MP-1 with a big 10-12' whip (!) works on 40 and 20M SSB at QRP power levels, at least in a contest situation, and on 17M (HFPack calling freq) where folks will look for and work a weak signal. Same MP-1 with a 3' whip has worked from a car on 20M and higher bands, but the car provides a much betetr ground plane vs a bike.

What I'd consider:
Run wire zip tied, taped, or glued to the longest bike flagpole I can find. Use a small autotuner (Elecraft T-1 or LDG) at the base. Counterpoise wire on bike frame and bike frame as ground. Possibly substitute bike flagpole with a shock-corded tent pole if it's stiff enough at the joints.

I was looking at my various telescoping poles last night wondering if I would risk any on my bike for use while in-motion. Both the MP-1 stock whip and MFJ 10-12' whip footer are both too flimsy. The extended Buddipole whip (9 ft I think) looks stronger so I might risk it at full or partial extension. The Buddipole shock-corded whips may be rugged enough but I don't have one to look at. The vendor and the yahoo group are very responsive to questions.

Or, replace the autotuner with a loading coil at/near the base or center of the antenna(esp if the pole splits into 2 section - I have one that does). Articles on making various homebrew packable verticals should get you started on coil dimensions. I'm thinking the info on building a homebrew buddipole in particular. If the pole is 1-piece, either cut and fabricate a joint, or just pull it down and clip to front of bike for loading onto the train.

If you buy rather than build, I think (in roughly increasing cost) mono-band hamsticks (and equivalents), the HF mobile antennas from HyGain, Diamond, and Comet, (maybe one of the Outbacks) and the MP-1 and Buddistick are the way to go. There are some recent posts in the Buddipole Yahoo group re: bike-mounting a Buddistick.

To re-iterate my previous post, if you get an FT857, I would remote mount the control head on the handlebars and stick the radio and batteries on a rear rack trunk or pannier where they are better protected from weather, collision, and won't affect bike handling. An 817 can be mounted on handlebars or placed in a handlebar bag, or you can mount a simple volume

control, PTT, and freq up/down buttons and stick the rig in the back if you are OK operating "blind".

Buddistick on a bike
Posted by: "tomk3mov" tomk3mov@... tomk3mov
Tue Mar 8, 2011 6:29 am (PST)

I recently saw a YouTube video of Budd Drummond riding his bike while using a Buddistick. The video did not go into a lot of detail about how the Buddistik was hooked up to the bike and whether the bike frame itself formed a suffient counterpoise.

Can someone direct me to more information on these subjects?

Barry,

I posted my question with Budd's Group the same I posted it here. Below is his response.
==========

HI Tom.....Budd here, on Tuesday morning.

Go to a trucker stop and check out the aluminum mirror mounts for CB whips.
  At about $10, they are an excellent buy. They will grab any handle-bar,
and if you crank down on the hardware, that makes a very sturdy mount.

On my trike, the continuity of all the parts is so good, I have never
fooled with a radial. The handlebars, the frame, the aluminum seat frame
and even the wheels show excellent continuity.

As the higher bands heat up, bike mobiling is going to get much more
popular.

I've borrowed bikes in Hawaii, St. Martin, St. Lucia, and all over the
States. I just take the bike clamp with me when I think I'm going to go
bike mobile. For portable use, if you can get a bike with a book rack on
the back, it's a nice place to mount the radio and/or the antenna.

Budd

This site was removed because it was a sales pitch for Viagra and Cialis. I'm not sure how it got on the BMHA group.

However, Robin Williams once commented on bike racers using Viagra as a performance enhancing drug because it helped them ride long and hard. And it eliminated the need for them to carry a kickstand.

With appropriate connectors it might get us on 440 mhz.

2553. Tour de Cure Brighton Michigan June 11 2011

Yahoo group: BMHA
Date: 2011-03-20 22:47:33 UTC
From: brucefreeburger
Topic: 2553 Message: 2553

Folks,
I ride the Brighton Mi Tour de Cure every year, last year was my first as a ham. We had three hams that were bicycle mobile last year. For 2011 I set up a team called Amateur Radio on Bikes to both raise money for Diabetes and raise awareness of hams serving bicycle rides.
So far it's more Team Little Red Hen vs Team Red. I'm the only guy on my team. Entry fee is $15 and you have to raise $200 in pledges.
It is MUCH simpler to join my team at the same time you enter. Click on the "Click Here To Join My Team" on the lower right of my photo.
http://diabetes.brucefreeburger.com/

Thank You!

2554. Dayton Hamvention BMHA Saturday bike ride?? Creekside trail!

Yahoo group: BMHA
Date: 2011-03-21 15:23:12 UTC
From: Arnie Grubbs
Topic: 2554 Message: 2554

Hello group!
Its that time of year again... the Hamvention is getting close, and I thought I better get some info out for those who are interested in taking their rolling hamshacks out for a spin on the trails of Dayton.
I thought that this year we would try out a different trail... The Creekside trail.Check out the trail on this interactive web site for the location and how to get there....
http://www.miamivalleytrails.org/Interactive-Maps.htm
I have looked at a few of the maps and gotten some feed back from one of the "locals" about the trails and was told we should try the "Creekside" trail. It is a 17+ mile trail that ends Xenia. It looks to be a very nice trail. Paved, with restroom stops with water ever so often. There are places to eat along the way.. and even a bike shop if it is still in business..
Here is a site with lots of info on the trail...
http://www.miamivalleytrails.org/creeks.htm
We will start on this trail at the 'north' end of the trail (green trace on interactive map) gathering at the parking area just north of the trail around 1:30 PM, and departing on the ride at 2PM. We will ride south a way, and return on the same trail. Afterward we will have something to eat in the local area, depending on what the group decides would be good place. There are several
The parking area / trail head is just north of the end of the green trace of the trail on the map. This is where the trail meets the "Mad river trail", which continues West into downtown Dayton.
We would enter the park, the "Eastwood metro park", to get to the parking area at the trail head, from "Harshman road",. Going South on Harshman road from the intersection of highway 4 and Harshman, take the 2nd road exit going west into the park.Follow the road to the larger parking area that the road takes a right angle turn to pass thru the parking lot. This is where we will start from.
Check it out on the Satellite view of the map to get a better idea where this is.
A few tips...
To get to the park, from Hara Arena..
Take Turner road and head east, this is a divided 4 lane road. After a while the road will be renamed Shoup mill road, and then a little farther on, renamed again as Needmore road. It will cross I-75. Keep going east on the 4 lane. it will turn southward, and at highway 201 it will be renamed Harshman road. Where it becomes Harshman Road, it will no longer be a divided road. Continue southward. on Harshman. After you cross under highway 4, Harshman becomes a divided highway again, and you are just about to the park. Continue south past the first road going west after hiway 4. . At the 2nd road going west, I believe there is a stop light. Turn west and go into the park. Then follow the road as mentioned before into the parking area at the trail head.

I hope that these instructions and map are clear enough for everyone..Even so, I will be on 146.55 Mhz simplex for talk in starting around 1:15 or so. Call KA0NCR if you run into problems finding the place and need help.
Please drop me an E-mail at KA0NCR at Yahoo.com letting me know you are planning to attend, and if you don't have a 2 Meter rig, I will send you my cell phone number. Either way we

will be sure to listen for you.
I have placed an order for good weather for the ride, so I hope to see lots of you there!
73 - Arnie - KA0NCR

Topic: 2501 Message: 2555

What is the advantage of this over just using a tent?

One thing I have thought about but not tried is using the bike to support a hammock. Perhaps a trailer would help with this.

2556. HF Bike Antenna

Date: 2011-03-23 01:40:47 UTC
From: macleodan@ymail.com
Topic: 2556 Message: 2556

Recently, I have been experimenting with bike antennas.

Construction of 15m antenna and ground system:
http://mm0hai.net/blog/2011/03/19/HF-Bicycle-Mobile-Experiment-Part-1.html

Testing - surprisingly good DX achieved:
http://mm0hai.net/blog/2011/03/21/HF-Bicycle-Mobile-Experiment-Part-2.html

Can anyone explain why the ground is improved with series capacitance? Is there a canonical way to tune this sort of system?

I wonder if a half wave would be better because it would not rely on a good ground. It would require loading coils at the ends though.

I've used ham sticks for QRP--3 to 4 watts on 20 and 40 on both a bicycle and a trike (It requires a stick for each band). I've tuned the antenna in question to a center frequency prior to departure and left the tuner at home. I'm a rag chewer, not a DXer, so my configuration doesn't work for everyone.

Here is what should appear in the program for the Dayton Hamvention for the BMHA Forum:

Sunday May 22, 2011 09:15 - 11:15

Bicycle Mobile Hams of America (The 21st Annual BMHA forum at Hamvention)

Moderator/Speaker: Mike Nickolaus, NF0N
Speaker: Norm Huber, N9ZKS

Bicycle Mobile Hams of America got its start in 1989 when a QST article by Hartley Alley, NA0A asked hams who operate their radios while bicycle-mobile to get together and form a group. BMHA hosts a website along with the BMHA Yahoo Groups forum.

Norm Huber, N9ZKS, will present "Boy Scouts of America, Bicycling and Ham Radio. Three hobbies blended with service to others", his experiences with BSA combining Bicycling, Ham Radio and being a badge counselor.

Mike Nickolaus, NF0N, will present "Ride to my 50th High School Class Reunion", a recreation of the ride by NA0A that started BMHA.

We plan to have bicycle mobile displays and demonstrations of each will be conducted.

Mike Nickolaus, NF0N
BMHA Forum Moderator

As noted, we hope to have bicycle displays so those who would like to display their bike setup, please bring yours, we will allow time after the main program for you to demonstrate and talk about it.

Hope to see many of you at this years forum.

Mike, NF0N
BMHA Forum Moderator

In putting the radio on the handlebar, are you not concern that the vibration from bike riding will break something on the radio? Will you made a vibration dampener or some type of shock absorber?

There is a Facebook page

http://www.facebook.com/home.php?sk=group_158845360826987

You need to search by Bicycle Mobile Hams of America (not BMHA) and it is a closed group so you have to Join it and wait to be admitted before you can get onto the page.

>>> <n2lrb@...> 4/6/2011 8:27 PM >>>

A facebook page would be great!

I have thought of that; what I think I will be doing is using
a piece of foam to put behiand the control unit.

The radio (and Icom i 7000) has a separate control unit that
I can mount with a 1 inch thick piece of foam behind it so that
it can absorb shocks.

Bump, to ask if anyone is thinking they might like to do this ride..?

I'd Like to have some feedback to kind of plan on how many people to expect.... Please drop me a note if you even think you might be interested to "ka0ncr AT Yahoo.com" "AT" of course means "@"..

Its not a commitment to ride, I just want to get a feel for if anyone is going to show..

Thanks! Arnie KA0NCR

To jump in here a bit: I have a 857D. It has ventilation holes. It's designed to be mounted in a car, and would have to be separately weatherproofed.

What sort of greater than 5W VHF/UHF rigs are people using on bicycles?

2566. Mounts and headsets

Yahoo group: BMHA
Date: 2011-04-10 03:23:28 UTC
From: John Goerzen
Topic: 2566 Message: 2566

Hi folks,

I've been riding bicycle mobile for a little while now, and appreciate the suggestions I've had from people on this group getting me started. I've collected them at http://wiki.complete.org/BicycleMobileAmateurRadio

I ride with my Yaesu VX-7R 5W HT and a NMO 5/8 wave (on 2m) antenna mounted on my bike rack. I can hit one nearby repeater reliably, and one 40 miles away for part of my 10-mile commute.

My weak spots are two: the mount for the radio and the headset.

I like the VX-7R setup in part because the VX-7R is already waterproof, the internal battery will easily last for the 2 hours I could spend on the bike in a day, and thus it is a simple setup. I can also listen to FM broadcast radio if I like. More power would be nice someday, so I'm also all ears for suggestions on other small, easy rigs.

I've had a terrible time finding a mount for it. I want it on the handlebars so I can see the screen and change stations, turn on/off the FM broadcast reception, etc. I've struck out at both bicycle and ham radio stores. I bought a SM327 "universal mount" from Arkon, but due to the thickness of the radio and the placement of the side buttons, it doesn't achieve the most secure mount. I ride 3 miles each way on non-paved roads and the radio has more than once been jolted out of its mount. Fortunately it has never become caught in my front wheel spokes, and I certainly want to keep it that way.

The second problem is the headset. I bought a Pryme SPM-400D [1] boom headset. The concept is pretty nice. It has a remote PTT button with a small velcro strap on the back, which I can attach to the handlebars at a convenient spot. I added some foam around the mic to cut the wind and it performs well. Problem is, the way the earpiece attaches to my ear hurts. A lot. I think my ear is too big for it or maybe my helmet straps push it against the ear too much.

In any case, most of the headset options I see have the PTT button clip onto a shirt -- not helpful.

Any ideas for me here?

[1] http://is.gd/jr64rX

Thanks,

John
KR0L

I Run the IC-7000 Mobile and love it, I bought a second one to use Portable but rarely do because once you get it out in the full sun or bright daylight it becomes impossible to see the display, so I use the Kenwood TS-50 on the beach or picnic table, so something to check.

Topic: 2566 Message: 2568

John:

See messages #2435 and #2332 for what I'm using with a VX5 and VX8. There are photos of at least the VX8 setup under my call in the Photos section.

I had problems with the Pryme headset (our ears and helmets must be similar!). I think I mention in the messages (or search for other posts where I discuss headsets) a lightweight headset I think works better.

From: Mike
Topic: 2569 Message: 2569

Here are more details for the Dayton Hamvention BMHA Forum on May 22nd. We encourage any to bring their bicycle and radio setup to the forum room. We will set aside time for you to display your setup and demonstrate to the group. In addition to the program speakers, we will have free Adventure Cycling magazines, 10 free Adventure Cycling memberships to be given away and a few decals to be given out. There is also a BMHA Bike ride on Saturday May 21st, see Arnie, KA0NCR's message for the details. Come and ride, have a good time at the Hamvention and attend the BMHA forum.

2570. 20M SSB bicycle and pedestrian mobile

Yahoo group: BMHA
Date: 2011-04-24 17:09:40 UTC
From: g4akc_mobile
Topic: 2570 Message: 2570

As the weather here in the UK has been so good, I have been out over the last few days pedestrian and bicycle mobile by the edge of the sea in Blackpool England, cycling along the promenade for about 4 miles.

On Friday afternoon I was out pedestrian mobile with fair propagation into USA, Canada and South America.

Went out bicycle mobile Saturday arriving at 0700L at my favourite location near the water. Although it was low tide the band was in excellent shape.

I was joined by Stephen G7DIE car mobile, who was operating about 4 miles south of me.

We joined forces and had several QSO's into VK2, VK3, VK6, W6, and E51 (cook Island)in all about 40 really good longpath DX QSO's, most reports were 59 both ways.

Today(Sunday)been out pedestrian again with outstanding long-path band conditions, working with low power into VK and ZL with power down to less than 1 Watt at times with good copy into VK.
Worked more than 100 VK and ZL stations between 0700L and 1100L time most of the time running 50 to 100W.

The suprising thing was that the band stayed open on the longpath to VK and ZL
until 1000L with signals still 59+ even then.

Stephen G7DIE joined me at about 0900 and can bear witness to the very strong longpath signals still present at 1000L from VK.

All in all a very enjoyable morning and well worth the effort on getting up early!

Dave,

Great work. I've done 20m and 40m using a Bike Friday bike and a Sun trike, launching a QRP signal from the North Texas prairie with a ham stick. Though my accomplishments don't nearly approach yours I've had fun. The trike is heavier and slower, but it works better for me because if I decide to stop and chat, CW or SSB, I have a place to set while it happens, hi.

Press on my friend, you're turning mobile QRP on it's ear.

From: g4akc_mobile
Topic: 2570 Message: 2572

Hi Scott,

Thanks for your comments and great on the trike ...

I sometimes think I should refit my radio gear to a trike as I rely in the bike stand a lot when I stop and the trike is so much easier.

I know Budd W3FF get great results from his trike and we have had a couple of QSO's bicycle to bicycle mobile UK to west coast.

It may be a project for later this year, as I am hoping for some early retirement from work and so I can enjoy the finer things in life like bicycle mobile!

Been out again this morning 0600 GMT for a couple of hours and the long-path just as good as yesterday into VK and ZL so had a great time and got back a short while ago.

Keep in touch and 73's ...

2573. Re: 20M SSB bicycle and pedestrian mobile

Yahoo group: BMHA
Date: 2011-04-25 17:34:15 UTC
From: n7net
Topic: 2570 Message: 2573

Dave,

Thanks for the swift response.

You can see my current setup in the photo section--N7NET's Stuff. It's called HF Trike, next to the last photo.

The battery came from a burgler system. The antenna is a MFJ 20m hamstick tuned so that the coax runs straight from the radio to the antenna. The radio is a MFJ-9420, SSB with a CW board add on. A full battery sends about 8 watts to the antenna. Hard bumps telescoping through the small front wheel sometimes change the frequency, so I've tried my 706 with the power turned down as low as it will go because I can lock the frequency. But there is so much going on inside the 706, in addition to making a signal, that it quickly depletes my small battery. So I've gone back to my bare-bones 9420 and watch where I'm going more closely.

Sideband is easy on the move, but I have yet to fabricate a convenient way for CW while on the go. That's what makes the trike shine over the bike. I have a place to sit and use an old Jeep key that fits on my thigh.

The chase is where the fun seems to be. If tricycle mobile was as simple as dialing a telephone I'd soon be looking elsewhere for a challenge, hi.

Hi Scott,

The trike looks great!

We must arrange a sked soon ... I have talked to quite a few bike mobilers from my bike, bike to bike on 20M SSB including Budd W3FF/BM and W9XS/BM.

Keep in touch ...

73's ... Dave G4AKC

> The battery came from a burgler system. The antenna is a MFJ 20m hamstick tuned so that the coax runs straight from the radio to the antenna. The radio is a MFJ-9420, SSB with a CW board add on. A full battery sends about 8 watts to the antenna. Hard bumps telescoping through the small front wheel sometimes change the frequency, so I've tried my 706 with the power turned down as low as it will go because I can lock the frequency. But there is so much going on inside the 706, in addition to making a signal, that it quickly depletes my small battery. So I've gone back to my bare-bones 9420 and watch where I'm going more closely.

2575. BMHA Forum at Dayton Hamvention Coming Soon

Yahoo group: BMHA
Date: 2011-05-16 18:47:10 UTC
From: Mike
Topic: 2575 Message: 2575

Just a reminder of the BMHA Forum at the 2011 Dayton Hamvention on May 22nd at 9:15 in Room 5. The forum is from 9:15-11:15 in Room 5. The room is large so bring your bicycle setup with you if you wish, display the setup and if you need time to talk about it, we will give you time on the program. I will have Adventure Cycling magazines to give away along with 10 free memberships to Adventure Cycling.

See the BMHA website for details about the BMHA bike ride to be held on May 21 on one of the local Dayton bike trails. Meet your BMHA friends, ride a few miles and have a bite to eat.

Hope to see many of you at the forum on Sunday, May 22nd.

Mike, NF0N
forum moderator
BMHA Secretary/Treasurer

2576. Dayton Bike Ride

From: James French
Topic: 2576 Message: 2576

I am wondering if I could 'tag' along for the ride from Hara to the park with my bike Saturday?

Also, is there a booth where members can meet at to socialize?

James,

Yes of course, everyone is welcome to join the ride, come and ride with us. As far as a booth or meeting place, we did not set up anything like that this year. Just the ride on Saturday and the forum on Sunday which you are also welcome to attend, would like to meet you there.

Jim, for some reason I can't get a reply to you, it is flagging me as spam I think.

Here is my reply:

Jim,

We usually don't carry the radio as all the frequencies seem to be used or overused. We park in the vendor parking lot as close to the Silver Arena entrance as we can. Our vehicle is a red ford transit van, sort of hard to miss. On Saturday we will be near the Silver Arena entrance as that is where the HF Packers have their meeting just outside the arena. Both Arnie, KA0NCR and I will be at that entrance between 12:30 and 1:00. If you can meet us there we can load you up and go to the ride. We are planning on bringing a rack to carry at least two additional bikes, ours will fit inside. My phone is 712-223-3164 which might be best to try to call me.

Mike

Hello Mike.

Thanks for your reply about any central meeting place at Hamvention itself. I am not sure yet if I will be staying for Sunday or not yet. I am giving myself till Thursday morning to make that decision.

This was what I was meaning in my recent message about 'tagging' along. I was referring to getting a lift for me and my bike. As I have no idea about directions from Hara (yes, I have read the directions posted on the website), I get easily get 'Lost' until I know my way around better....:)

If there is not room for me and my bike with someone, I could offer someone a ride as my rack can handle two bikes if there is anyone that needs a lift and can't find one.

I will monitor the list until Friday morning about 9:30am to see if there are any offers or needs as that is when I am planning to head down to Hamvention.

2580. Dayton Hamvention BMHA bike ride.. The trail looks good!

Yahoo group: BMHA
Date: 2011-05-19 23:10:50 UTC
From: Arnie Grubbs
Topic: 2580 Message: 2580

Hello Group!
Mike, NF0N and myself (KA0NCR) went out to check out the trail today, and it looks likeit will be a nice one. We made it 15+ miles, just about to Xenia station, before it startedto rain. We turned around and headed back, with rain varying between a mist to a goodrain soaking.   Other than the rain, we had a good time.
The weather forecast right now for Saturday is partly sunny, high about 80 and a wind from 3-6 mph.   All in all it looks like it will be a good time!
I hope that there will be a good sized group that shows up to ride!
73 - Arnie KA0NCR

2581. Max recommended trike mobile antenna height

Yahoo group: BMHA
Date: 2011-05-23 03:49:08 UTC
From: ab8xa
Topic: 2581 Message: 2581

What's the maximum recommended antenna height above ground. I know from RVing the standard overpass is 13' 6", but how often does one come across these?

Thanks!

Moe,

I don't know if 13'6" is a law or a regulation, but I know you can be cited for being on the roadway with anything taller.

That's reason enough for me, Scott. Thank you!

For now, I'll be using my KX1 and don't see sending Morse Code while pedaling--rather finding a spot to sit in the mobile lawn chair, i.e. the seat of my old folks' Terra Trike Rover tadpole trike, and operating from that with a counterpoise out. I'm going to try to mount my Buddipole Low Band Vertical on the headrest, using a homemade mount, depicted in red in the photo in my AB8XA group album:

http://yhoo.it/kpNwYd

The top of the mount will be 37" above the ground, which with the VersaTee, low band coil, and 9.5 foot telescoping whip, will total 13' 3-5/8". I may need to raise that slightly to clear the back of my helmet (we'll see). Just planning ahead in case I eventually get the new all-mode KX3, which would give the option of phone when underway.

73 and thanks for your response.

Any other suggestions?

Moe,

I ride a trike too, a Sun. I use a hamstick antenna because they don't require a counterpoise. But they aren't nearly as effective as your Buddi Pole, either. I have an aging pair of MFJs, 9420 and 9040. I do SSB on the run, but I have to stop for code and I send with a KY-116/U I found at a hamfest. Some folks call it a Jeep key because it was used by the forward artillery spotters.

Band conditions are improving.

Nice trike, Scott! I can get into a Sun tadpole, but can't get out very gracefully, LOL!

I may try to relocate the KDP1 iambic key to under the right side grip with a 3.5mm stereo extension cord. The Rover uses a twist grip shifter, so it may be tricky.

Going to spend a lot of time with the MFJ-269B getting the best coil and radial settings. Hopefully, the tuner in the KX1 will help with the narrow bandwidth.

This sounds like it's going to be a blast!

Thanks for your help, and 73!

Road: 13'6". Bike paths: probably around 8 or 9'. Gobi desert: how tall
can you make it without flipping over or breaking the support (trike frame)?
Your limiting factors are the strength of the base (the trike) and overhead
obstacles. Also the weight and wind-loading of the antenna come into play.
You don't want it to act as a giant lever and flip you over.

Topic: 2581 Message: 2588

Moe,
From the Federal Highway Administration:

http://ops.fhwa.dot.gov/freight/sw/overview/index.htm

"No federal vehicle height limit is imposed. State standards range from 13.6 feet to 14.6 feet."

I suspect that your maximum is going to be a practical or engineering maximum rather than a legal maximum standard. Based on riding across the USA last year I would say that on the road in most states you would be able to either take things slowly enough that your whip would flex as you went under obstacles. However off the road I can think of things that I would not want to contact that could be considerably lower. In many parts of the country I saw three wire power points of entry. I would hate to hit a hot lead with bad insulation and become a 100+ amp path to ground. Also in Wyoming I went through some thunder storms that made me wish that I was much shorter. (lightning strikes very uncomfortably close) The other question that I have is what will the experience of a whip strike be with the bike. If you hit an angled tree limb what will the resulting roll moment be like on the bike? While much of OR, ID, MT, WY,CO,KS,MO and IL would have little trees to hit. Going across KY and VA would be long days of BONG...BONG...BONG.

My recommendation is experiment. Figure out a way to shorten or pull down the whip and go out and ride it. My bet is the best platform will be a trike possibly even with a long tongue hanging off the back and a whip flexible enough that you can bend it in one long arc down to the front for low crossings. Send us pictures of what you come up with.

Thanks, Dean!

I got a piece of 1/8" x 2" x 36" aluminum and made a bracket held on by bungies.

Pictures are in my AB8XA Photo Album, including the KX1. Looking for comments/suggestions on this implementation.

> I suspect that your maximum is going to be a practical or engineering maximum rather than a legal maximum standard. Based on riding across the USA last year I would say that on the road in most states you would be able to either take things slowly enough that your whip would flex as you went under obstacles. However off the road I can think of things that I would not want to contact that could be considerably lower. In many parts of the country I saw three wire power points of entry. I would hate to hit a hot lead with bad insulation and become a 100+ amp path to ground. Also in Wyoming I went through some thunder storms that made me wish that I was much shorter. (lightning strikes very uncomfortably close) The other question that I have is what will the experience of a whip strike be with the bike. If you hit an angled tree limb what will the resulting roll moment be like on the bike? While much of OR, ID, MT, WY,CO,KS,MO and IL would have little trees to hit. Going across KY and VA would be long days of BONG...BONG...BONG.

I have seen tree branches as low as about 10 feet above the ground.

If you ride on sidewalks, some building canopies are about 7 feet off
the ground.

Now, that's an interesting question. . . .

If my antenna on my bike rips an expensive canopy of, say, the Waldorf
Astoria Hotel as I am walking my ham radio bicycle on the sidewalk; who
is liable?

Thanks, Mark. The tree branches on bike trails are the biggest threat around here. I'll wind up riding with the antenna collapsed on those, operating at the rest stations.

As far as liability...I'm sure they have insurance.

Moe:

Thanks for the suggestion. I am still working on the antenna (home brew) and designing a quick and easy way to collapse it.

I am also taking a more critical look at all of my various routes for low hanging stuff.

For those of you in Portland, Oregon; the downtown sidewalks are *littered* with low conopies and awnings. This is why I have asked the liability questions.

Since I don't have a car, and no car insuarance. I don't have liability. If it damanage a canopy, I hope it's the owner's liability since they put it over a public sidewalk.

The antenna, by the way will consist of a six foot fiberglass rod with 1/16 inch diameter copper wire glued to it. At the top end of this rod will be a loading coil with a clip lead connected to a 4 foot 1/4 inch diameter titanium whip.

Both the rod and the whip will be easily removable on the road. I plan to be able to bungie them to the frame of the bike if I have to ride in low places.

We're looking into a custom carrying case with an integral shell to protect the front panel. It would also have accessory pockets and a strap for either over-the-shoulder or as a belt-pack. Can't say when this might be completed.

For a bike mount, I think any of the various RAM-Mounts designs would work using the fitting the info sheet says is on the back of the case(RAM's minimal zip-tie mount excepted - while it works fine for an HT, it is probably not strong enough for anything larger) along with decent weather protection for the radio. Weather protection would also benefit pedestrian-mobile users.

Sure I worry about it, but I've had a VX-8 bolted to my bicycle for 3 years (1500 miles) and it's still working fine. I will be disappointed if/when it fails, but I've had lots of enjoyment so far.

2600. Re: Elecraft KX3

Yahoo group: BMHA
Date: 2011-05-26 21:59:24 UTC
From: AOX
Topic: 2596 Message: 2600

It's just you ;?] Actually there are at least a few schools of thought on vibration and electronics on bikes.
Some folks insist that mounting even an HT on the handlebars will damage the radio, break the RF connector because of weight and vibration of the cable and connector, etc, etc.
Me, I like to USE my radios. If they fall apart I either repair or replace them. I have anal ham buddies who refuse to even TRY the radio until everything is planned out in advance, all precautions taken, etc. Me, I like to lash it on, try it out, and see if and how it works, and adapt mounts, antennas, batteries, etc, as I go and grow in experience with the radio(s) on the bike. I never arrive at a "perfect" system because at some point the temporary solution turns out to be acceptably robust and I just continue using the radio and other electronics as is.
My particular example is my Kenwood TH-D7A, which has never had a reputation for ruggedness. In spite of that I have used mine for over FOUR YEARS on my bike, commuting year round, 5 days a week, 3500+ miles per year, missing only on days that are too slippery to allow safe passage on 2 wheels. I cannot recall a vibration issue with this radio, though I did burn out one of the antenna switching diodes internally when I transmitted into a broken antenna one too many times. I rode for several months with only the radio belt clip clamped onto a handlebar bracket. Then I graduated to an aluminum bracket which kept me occupied for several more months. Worrying about the constant vibration, yet not having experienced any issues, I fabricated a homebrew mount system using RAM mounts and a "sandwich" of foam packing material between two mounting plates to absorb some of the vibration.
In short, I have enjoyed YEARS of bicycle-mobile using VHF and UHF thru the D7 (and HF via a nearby remote base) with no vibration issues. If I paid a few thousand for a KX3 I suppose I'd worry a bit more about it, but a simple sandwich mount as described would ease my fears. Most of the bike-HF'ers I read about keep their HF rig in a pannier or pack safely wrapped (and the antenna folded up and tied down) until they arrive at a desired stopping point whereupon they set up the radio and antenna to operate quasi-portable. Years ago I talked to a bicycle-mobile ham in Boston (from NM) IN MOTION, on 10 meter SSB, running 25 Watts to a quarter wave steel whip, with a lead acid battery running the radio.... I want to do that myself someday, especially when 10 gets hot again.

From: Wayne Burdick
Topic: 2596 Message: 2601

Shock and vibration are serious concerns in any vehicle application. I'm not sure what level of testing and specification of these parameters is practical for the KX3.

I would certainly avoid mounting it rigidly to a frame member that is going to be subjected to undamped impact. Are there damped mounts available for bike-mounted electronics in general? The KX3's own mobile mount will include a small amount of damping (foam pads between the mount and the radio).

The KX3 without batteries weighs about 18 ounces. This might help when looking at mounts.

2602. bike-mounted KX3 audio

Yahoo group: BMHA
Date: 2011-05-26 22:08:07 UTC
From: Wayne Burdick
Topic: 2596 Message: 2602

The internal speaker on the KX3 is very small, quite adequate for a reasonably quiet operating environment but probably not up to outdoor operating in a stiff breeze or traffic noise. The single speaker also doesn't take advantage of the KX3's audio effects (simulated stereo, binaural pitch mapping, and dual watch).

A pair of miniature powered speakers would solve both problems. Has anyone used bike-mounted stereo speakers that they'd recommend for this application? If something decent is available, we'd like to mention it in the KX3 manual, or possibly even offer them as an accessory.

I've been using a Radio Shack 202 HT on and off the bike for close to 20 years. It still works. When I was still working I kept an Icom 2m mobile on the dash of several tractors, some air ride and some not. After thousands of miles back east on I-80 and I-95 I finally cracked a circuit board, and I replaced the radio, but I certainly wouldn't worry about an HT.

I have put 113,000 miles on my '05 Wing with D700 radio in the trunk and control head on a RAM mount on the faux tank. My only failure was a home made cable to my helmet speaker/mike and handle bar mounted PTT button. Before that it was a D7 on my 1200 for about 30.000 miles. I have a mount (See past issue of newsletter) to carry my D7 and Garmin V on my bicycles, track bike fixed and Giant 980C. Early on there were a number of owners of SMA equipped radios had problems with antenna connectors. Rule I follow is to insure I use one of the adapter cables with a SMA connector at the radio and the PL connector and heavy cable not hanging from the radio.
Guess I have to say, I've got it to use it.

I think for my upcomming bicycle installation; the radio (Icom IC 7000) will in in a pannier bag. The remote front panel will be on a piece of 1 inch thick foam.

The bicycle (which I have not yet purchased) will be a Dutch style heavy duty bicycle with a sturdy frame.

You will have to read the blogging of my trip to get the whole story but I ended up spending an extra day on HWY 12 on my way into Montana. I had family that was concerned that they hadn't heard from me so I picked up a spot for them to keep track of me. I had it mounted on the stem from MT through Colorado Springs. I believe that the rough roads in WY just shook the thing to death and then it gave up the ghost in CO. I replaced the unit and mounted it on my gear in my trailer and haven't had any trouble since. I am thinking about a better antenna implementation and APRS. I am noodling the vibration issue and have some ideas. Does anyone have any ideas for finding what frequency the vibration on a bike is?

Has anyone had any experience with a bluetooth headset? I know the VX-8DR has an optional bluetooth unit, but I don't think that's going to be in the cards for me. I have a VX-7R and will probably get a Kenwood TH-D72A soon.

http://www.mckayproducts.com/store/Bluetooth.htm are the only ones I've found so far, and it is rather unclear to me if any of those will work with either of the radios I have.

What have people tried and what have you found works? The idea of not being lashed to my bicycle is, I must say, appealing.

I have tried one the McKay units. It works fine. As long as you have a radio with one of the supported mike plugs for the bluetooth adaptor. I forget if the VX7 is supported (I think so, my VX5 was not). You can probably pair it with other bt headsets, and the separate PTT button is a great feature (you can mount it on handlebars or near brifters and keep both hands on the bike).

I agree - no wires between me and the bike is GREAT!

The problem with BT headsets is wind noise. Some wired boom headsets address this, I have a McKay lightweight headset for the VX5 that works reasonably well. BT ones generally don't.

Oh, it means more batteries to worry about running down on a long ride. As I experienced on a century ride where the headset I used with my VX8 quit part-way thru. Bring something to use as a backup.

Folks-

does anyone know if the McKay model 3803 for ICOM works with ICOM amateur HT's? Not sure about those locking screws on the adapter in the photo. It is unclear from their webpage if these work with the amateur radios. I too would love some sort of BT option for my HT while commuting to work on the bike.

I only have about 10,000 miles on my original TH-D7 running APRS to a bike-flagpole J Pole No vibration issues with the D7, and I've had to repair the homebrew J Pole a couple times in the last year of daily commuting over some very rough roads and intersections. I've had bike forks and frames crack, and fenders crack and fall off, but no damage to the electronics, thank goodness.
I loaned one of my spare APRS setups and a J Pole to a cross country family on a 5-seater bicycle and it made it from NM to Northern CA before it was destroyed when the bike trailer caught fire and burned to ashes. THAT loss was caused by a vibration issue: The insulation between the 10 AA Nicad cells rubbed through, allowing a shorted Nicad that overheated and caused some propane cylinders packed next to the battery pack to explode.
The only downside to APRS is that the family gets addicted to watching your progress from afar, and when you go through a area with poor or no digi / igate coverage they tend to get excited and worried... and naturally, in such areas you rarely have cell phone coverage either :?)

I'd contact McKay and ask. They have good customer support as I recall. They used to have some models designed for the Icom HTs, and still do in the wired lightweight headsets. I don't know if they're out of stock at McKay or discontinued by the manufacturer.

Plan B would be to modify the cable for one of the available units to work with your Icom.

Have you done anything special to connect a GPS to your TH-D7? I've been running a TH-D7 and Garmin Foretrex 201 for several years and have had several vibration issues. I've noticed that if the serial stream is interrupted even briefly then the D7 will stop transmitting position packets. I initially solved this by removing the GPS jack on the D7 and soldering a beefier connector to it. That worked for a few years but I'm starting to have problems again. The radio is stored in a bag under the seat and has some bubble wrap for added protection. The GPS is mounted to the handlebars using a modified version of the Foretrex handlebar mount.

I've also noticed that one of my D7 battery packs has a loose connection in it or it has a loose connection to the radio because if I hit a bump the radio acts as if the power had been cycled.

Since I rarely have the D7 feed waypoints to the GPS I'm considering replacing the D7 with the new D72 which would permit me to eliminate the cable between the GPS and radio.

Jerome
Is the battery to your D7 a Kenwood, or aftermarket? I ask that because since I switched to an aftermarket battery, vibration will cause the power to cycle sometimes, but I never had this issue with the kenwood battery. The big issue that I had with the kenwood battery, was short operating time between charges.

I use a 90 degree 2.5mm radio shack audio connector to connect my Garmin Geko 301 cable to the TH-D7. The radio sits in a pouch that holds the connector firmly in place. With a 90 degree connector, you might be able to use a rubber band or velcro strip to hold the connector in place. With the setup I use, I've never had any issues with the data being interupted between the GPS and the Th-D7. I have since replaced my Garmin Geko 301 with a Garmin GPSMAP 62s. (after a couple of mountain bike mishaps, the Geko 301 has developed some issues of it's own) Maybe, by the end of this year, I'll replace the D7 with the D72, and eliminate the external GPS for most bike rides.

Actually, when you put it like that, it brings to mind I HAVE had a few issues with vibration. The main one that comes to mind is that my D7, sounding like yours, is not reliable using the battery pack that has spring contacts holding several AA cells inside. The least bit of vibration makes the radio voltage pop in and out, so I have stopped using that particular battery (holder). I've never had a problem using a sealed D&-style battery, and I have an original Kenwood version and a third-party version.
I have not encountered the GPS dropout problems you mention. I have used 2 separate Magellan Gold handhelds with their special cable that outputs data to the radio, and I have 2 Garmin 350's I've used with the Argent Data Systems converter cable. All GPS's and the D7 are mounted on my foam "sandwich mount plate" using RAM mounts, which are well worth the money. I've uploaded several fuzzy photos of this lashup (Look in the W5AOX directory). For a few months I used a piece of electrical tape to help hold the GPS input connector in the radio but now just let it hang and have never had a problem. I normally run the package off an AA pack of 10 NiMH cells in a pannier on the back of the bike. On occasion I've run this pack down and successfully finished the ride by unplugging the ext power cables to the radio and GPS, forcing them to run on their internal batteries. The Garmin 350 and Argent cable REQUIRE external power for the data to successfully link to the D7, but with the Magellans the system runs for maybe a couple hours doing APRS just fine on internal batteries.
I normally commute daily, at an hour or so per trip, morning and evening. Sometimes if I'm extra talkative on the D7 I run the battery pack down. If I took a longer trip or ride I'd attach my 12 watt Solarex solar panel to the back of the cargo to help keep up the battery state of charge.

I called McKay to inquire about a setup which would fit the ICOM amateur radios. They do not have one in stock, nor does their supplier have it. They do stock the commercial ICOM connector, which has the locking screws. The guy was very helpful, but it turns out they have nothing for my IC-91AD. Plenty of Kenwood stuff, though (should've kept my D7, I guess).

A typical 8-AA cell battery pack adds about 6-8 oz depending on chemistry (rough guess).

We don't have external battery options at this time.

Add 1" to the 1.7" thickness to account for the tallest knob (on top) and 0.2" to account for the feet with tilt-stand stored (on the bottom). But the knobs occupy the lower half of the front panel, so the upper half creates a space within the travel case for storage of accessories such as a two-piece telescoping whip.

Add 0.5" to the right side to account for the BNC.

Wayne

2626. 6m question, suggestion, help???

Yahoo group: BMHA
Date: 2011-06-06 18:37:39 UTC
From: n1evh@verizon.net
Topic: 2626 Message: 2626

I have a Trek 3700 mountain bike. I put a Topeak rack on the back of it and I made up a mount using some pieces of aluminum that I got at Home Depot. At the end of it I used a right-angle piece of aluminum from an old scanner antenna. I then used a 2" bulkhead UHF connector on it. Right now I have a Jetstream JTM3B dual-band mobile antenna (UHF mount). Got a great SWR on both 2m and 70cm and the antenna works pretty good.

I'm trying to setup my Diamond CR627B tri-band (6m/2m/70cm) antenna on my bike. The SWR on it isn't all that great... especially on 6m. It goes from
1.8:1 at 50MHz to 2.5:1 at 54MHz.

Now... I know the antenna on 6m is only a 1/4-wave and it needs a radial or groundplane to make up the other 1/4-wave of the antenna. Now... I would think that the bike's frame would offer enough... as I have continuity between
the antenna mount and the bike rack... and between the bike rack and the bike frame. Now from the end of the antenna mount to the the headpost is about 55 inches... and a 1/4-wave for 52MHz is 54 inches... but apparently the antenna doesn't like the bike frame for a groundplane.

So I decided to experiment with a wire counterpose out of wire. I then used an MFJ-269 Antenna Analyzer to try and get a ballbark SWR. I cut a 56 inch radial and put it on an alligator clip to make it easy to experiment with
it. Here is what I got when I tested it...

No counterpoise - lowest SWR was 1.8:1 at 52.000 MHz
Clipped on but hanging - lowest SWR was 1.2:1 at 47.750 MHz
Clipped on, run along bike - lowest SWR was 1.6:1 at 52.000 MHz
Clipped on, velcroed into place - lowest SWR was 1.7:1 at 51.600MHz

So... it seems as if a good SWR could be achieved if I were to trim the wire with it hanging free... but as soon as I run it along the bike frame... it goes
back to the way it was. Now... I can't just ride with a wire hanging from the
back of my bike.

So... does anyone have any suggestions on how to improve the 6m SWR???
Do you think the SWR would be better if I somehow isolated the antenna mount from the Topeak rack and then ran a radial along the bike frame???
Should I just say... forget about it... and stick with the dual-band antenna that is working great???

Any tips, suggestions, and so on to make this antenna work would be greatly appreciated.

Thanks,

Mike - N1EVH

Methinketh thou worrieth too mucheth.
If my SWR were that GOOD I would not worry about it at all. Especially compared to the complication of dragging the counterpoise wire behind me or putting a stiffer "stinger" out that far that would no doubt improve the SWR but complicate your being able to avoid impaling or at least "Twanging" others who get too close to you in your wanderings.
And, are you checking your SWR while you are sitting in the driver's seat. or while the bike is parked and no "backside" is up close and personal (within a foot or two) with the antenna? It DOES make a difference, and as you ride, the SWR will change at least slightly as you move around in the saddle. To safely operate the radio while in motion usually means less than optimal antenna situations. You can figure out all kinds of stuff like extra counterpoises, radials, etc, to use when you are parked somewhere and want to radiate a more serious signal.

The SWR tests that I've done have been with the bike parked and me not sitting on it. I guess I could re-test the SWR and see how it is when I'm sitting on the bike seat.

My SWR with the JetStream JTM3B (1/2 wave radialless on 2m and 2 x 5/8 wave radialless on 70cm) is MUCH better on 2m and 70cm than my Diamond CR627B (1/4 was on 6m, 3 x 1/4 wave on 2m, 3 x 5/8 wave on 70cm). Again... I don't understand why the bike's frame doesn't offer enough of a counterpoise/groundplane since there is continuity between the antenna mount and the bike rack and then continuity between the bike rack and the bike frame.

Since the wire counterpoise seemed to have an affect when it wasn't run along the bike frame... them maybe I'll see if I can come up with a way to isolate the antenna mount from the bike rack... and then try running a wire counterpoise along the bike frame.

2630. Re: 6m question, suggestion, help???

Yahoo group: BMHA
Date: 2011-06-07 17:45:36 UTC
From: AOX
Topic: 2626 Message: 2630

Well, for one thing, SWR doesn't tell the whole story. A low SWR only indicates the device on the end of the coax is absorbing power.... it doesn't necessarily mean it's RADIATING any.
Running your counterpoise right next to your metal bike frame is counterproductive; it needs to extend AWAY from the bike frame
Most antennas are designed to have some sort of ground plane underneath them, as close as possible to the feedpoint. You can use an ohmmeter to check ***DC*** continuity from stem to stern, and it will likely show good continuity. But, with an antenna mounted on the back end of the bike, there is usually only one area looking like a ground "plane".... which is narrow and lopsided. I'm betting if you added 2 or 3 radials to the base of the feedpoint, radiating out away from the bike frame, you would see both an improvement in SWR and radiation (transmit) performance. Trouble is, even at 19" for 2 meters, such ground radials tend to get in the way, and if the base of the antenna is down at your butt level, even with added radials, your body will capacitively couple to the antenna near field, distorting its radiation pattern. Thus the relative popularity of J poles and other elevated feedpoint "no ground plane" half wave style antennas.
A metal automobile body, while much larger than a bicycle and thus more useful for RF ground plane purposes, still represents a compromise even for VHF/UHF antennas, and more so for lower frequencies. The typical bicycle, being so much smaller, has little to offer in the way of ground plane, and thus is a weaker platform for antennas. Does this mean you should avoid deploying radios on bikes? No WAY. Accept the compromises and keep talking and experimenting and enjoying your radios. I get a lot more Gee Whizz comments and bragging rights running bicycle mobile than I do in any other vehicle, even though OF COURSE my signal will be weaker than if I was in a vehicle with more height, more metal for ground, more battery capacity, etc, etc. Another advantage a car has over a bike is because of its size it actually capacitively couples to the ground underneath it. Since a bike has such a small footprint with hardly any wide metal surfaces close to the ground, it suffers as an antenna platform, especially for lower frequencies.
For 6 meters, that 50-plus inch quarter wavelength dimension is hard to deal with on a bike. Yas, you have maybe enough metal in ONE direction for what might work as a ground reference for 6, but nothing in all the other directions. Usually you will note you have better range toward the front of the bike, if antenna is on the rear, even though your back is absorbing some of that precious RF as you transmit.
One hint from an old timer: Don't worry so much about SWR. Use a field strength meter instead to see which antenna and which setup works better. You may well find the Diamond with the high SWR actually transmits further than the JetStream lower-SWR antenna.
If you experimented, you might well find the antenna works better if mounted somewhere in the CENTER of the bike frame. Trouble is, that's where YOU sit; you don't have room for an antenna there.
Traveling to Dayton this year, we were passed by a ham TRAILING a counterpoise wire from his car for his 30-meter WSPR mobile beacon.
It worked.... both as an improvement to his RF performance and a source of jokes and wisecracks from fellow hams encountering him.
The basic law of antenna physics REALLY applies on a bike:
"If it stays up very long, it must not be big or tall enough!"

Years ago I talked to a bicycle mobile ham on 10 meter SSB, while he rode the streets of Boston (I was mobile in NM). He was running a small car battery and a 108" stainless steel CB whip on the back of his bike. I guarantee you HIS SWR was horrible.
Was he the strongest signal on the band?
Of Course Not. But lots of us enjoyed working him; he attracted lots of attention running 10 meters on that thing.
Don't bother trying to "isolate" your feedpoint from the bike frame. The bike frame is already acting as a partial counterpoise; the antenna just needs more counterpoise in other directions. Running your wire along the metal frame just couples them together, whether actually "connected" to each other or not.

From: n1evh@verizon.net
Topic: 2626 Message: 2632

Well... over the weekend I played around with setting up a 20m Hamstick on my bike in my backyard using the same antenna mount that is on my bike (making up a UHF to 3/8-24 thread adaptor)... and I actually got a 1:5.1 or lower SWR across the entire band. I'm sure the angle of radiation is pretty high. I then setup my FT-817 on my picnic table next to my bike and I tuned around. Heard a LOT of stations working the Alabama QSO Party. Heard one station in Alabama calling CQ so I figured I would call him and he heard me the first try. He gave me the standard "59" contest report... and then when I told him that I was in Massachusetts running QRP with a 20m Hamstick on mountain bike... he said I had a great signal for QRP in Massachusetts. Also heard a station in Italy that said they were mobile. He heard me... but not enough to make out my entire callsign.

Now... back to my VHF/UHF antenna situation. Even tho the antenna is mounted at the "far back" of the bike... I would think the only thing that would
be affected by the entire frame going off towards the front would be the radiation pattern... to a point. I remember back in my CB radio days (before
getting my ham license)... if I had a CB antenna mounted in the middle of the
trunk of a Firebird/Trans Am... there was a considerable lobe towards the front of the car and a noticeable null off of the back of the car. So with a
1/4-wave 6m antenna that needs a groundplane or counterpoise (as well as a 3 x 1/4 wave 2m antenna and a 3 x 5/8-wave 70cm antenna) in the back on a bike and the bike frame (which one would think would be enough metal to act as a groundplane) out in front of the antenna... that if anything
it would just make it somewhat directional in that direction. Am I wrong in thinking this???

That is one thing that I haven't owned since I got my ham license back in 1986... a field strength meter. I'll have to see if someone nearby me has one... or look in the ARRL Handbook (I'm sure they have plans in there on how to make one). If I were to compare the my JetStream dual-band antenna against my Diamond tri-band antenna... ... even tho the Diamond has more gain than the Jetstream... I'm sure there would be a difference in radiation angles (1/2-wave vs 3 x 1/4-wave on 2m and 2 x 5/8-wave vs 3 x 5/8-wave on 70cm). May not matter that much close up... but I'm sure it would have some affect over a distance (couple of miles). Again, am I wrong for thinking this???

In the past... I've just used the HT's stock or aftermarket antenna with the HT mounted on my handlebar... but wanted to do something with a mobile antenna to extend my range (plus I have the ability to hook up a dual-band

(2m/70cm) amp if I want/need to.

Topic: 2626 Message: 2633

About 50 years ago when I entered Ham Radio, I spoke with some Hams older than me who operated HF mobile. The rule of directivity was this: if your antenna was mounted, say, on the left rear side of the bumper, your best radiation and direction would be diagonally across the car toward the right front bumper. In short, the direction of the most mass and metal. I guess we've rediscovered an ancient truth. :-)

2634. Batteries and Waterproofing

Yahoo group: BMHA
Date: 2011-06-09 18:52:30 UTC
From: John Goerzen
Topic: 2634 Message: 2634

Hi folks,

I'm slowly moving along with my bicycle mobile setup. I thank those of you that sent me suggestions for mounts and headset stuff; I'm working on getting that situation improved.

I recently bought a Mirage BD-35 VHF/UHF amp designed to amplifying the output from HTs. This could be perfect for use on a bicycle. It's small, and can take a 5W signal up to the 35W range. This should be enough to let me hit repeaters some 35 mi away that are marginal for me right now.

My two problems are how to power it and how to protect it from the elements. I currently have an automotive trickle charger that might be useful (or not). An automotive or standard marine battery is out of the question due to both size and weight. What do people recommend as a simple and inexpensive way to get started? I expect to be on the bicycle a maximum of 2 hours most days and the HT battery is quite adequate for this. If I ever go HF, it would be nice if this could also work for that in the future.

Second problem is how to protect the BD-35 from the elements. It isn't waterproof or dirtproof as-is, but it has a large heatsink and probably can't be completely enclosed. What do you do in these cases?

All battery dot com has li-po packs that will do the job. Four cell would be right.

2636. Re: Batteries and Waterproofing

Yahoo group: BMHA
Date: 2011-06-09 20:07:48 UTC
From: n7net
Topic: 2634 Message: 2636

John,

If you ask six hams you might get six different answers, so here's what I do....

I stay with low power and use a small sealed lead battery about the size of a brick. I think it's a 7Ah. These batteries won't tolerate large charge rates, so you're better off to use a wall wart, about 0.5 A charge rate, to keep from ruining the battery. Keep your power leads as large and as short as possible so as to not loose too much energy to heat.

The battery will discharge pretty fast with 35W output. I imagtine a 30 minute rag chew will bring it down to the threshold voltage. You'll need to be selective on how long you use higher power.

I use a battery similar to the one mentioned above to power a FT-1300M that I always keep on the lowest setting.

Topic: 2634 Message: 2637

Hi Dave,

Do you mean this one:

http://www.all-battery.com/148volt-5800mahli-polypack-1.aspx

It's slightly over-voltage (14.8 vs. 13.8) -- think that would be a
problem? (Mirage specifically warns against driving that amp over-voltate)

How does one figure the discharge rate? Am I right to think that:

I = 35 W / 13.8 V = 2.5 A

operating time = 5.8 amp-hr / 2.5 A = 2.3 hrs (100% duty cycle)

and at maximum discharge rate of 15 A at 13.8, P = 15A * 13.8V = 207W

which should even be enough to operate a 100W rig if I wanted to in the
future, right?

(Hm, my FT-857D says transmit current consumption is 22A; I guess I
could bump down the power. Wonder why the difference there...)

What are the properties of Li-Po compared to Li-Ion?

2638. New Sanyo eneloops

Yahoo group: BMHA
Date: 2011-06-10 10:58:12 UTC
From: AB8XA
Topic: 2638 Message: 2638

I know many have moved on to other technologies, but some still use Sanyo's eneloop NiMH batteries for their price and ability to hold a charge for a long time.

I see this morning they have a couple of new models (and a wireless charging case), one with approx. 25% greater capacity:

Indeed. :) My 2 shekels:

John - I didn't see mention of what antenna you use. Before adding weight and complexity of an amp, I'd improve your antenna and feedline first. At minimum, don't use anything rubber-duckish or direct-mount to the radio. My favorites, in descending order of perceived performance:

Larsen (or similar but I have a Larsen) "no ground" 1/2 wave whip. Rugged, reliable, works well (based on watching how many APRS beacon packets make it into the system during my commutes). Mine is mounted on an NMO mount attached to a modifed behind-the-saddle water bottle carrier on my road bike (no rack). Limited to 2M. I picked up this idea from a website by the ham groups who provide comm support to the annual GOBA ride in Ohio.

1/4 wave whip with as good an RF ground as you can provide - metal rack, bike frame, coutnerpoise wire. Coat hanger in PL259 and a commercial 1/4 wave flexi whip seem to work about the same. I have this on my commuting bike; 3/8x24 mirror mount bolted to the rear rack and an adaptor to fit the PL259 or flexi whip BNC. Works 2M & 70cm, cheap, gets the job done.

Flagpole-mounted jpole or coaxial dipole (braid rolled back over feedline). Works OK but not as well as the 1/2 wave or 1/4 wave. Unsure if just several years of wear and abuse on the antenna and feedline; I did have to recently replace the connector on the jpole. Puts antenna as high as possible, doesn't require a ground, bike flag may help visibility to traffic. Tons of plans to make your own or several commercial models available.

Crazy ideas - I've considered (but so far resisted) a set of KU4AB stacked squalos (SQ-144 mobile stack, http://ku4ab.com/2m-horiz.html) on the commuter using that 3/8x24 mount or building a 2M Moxon rectangle using a bike flag (rigidity and directivity would be problems).

Test antennas by riding/driving to a known iffy location and doing multiple A-B-C comparison tests. Monitor the repeater output on a second radio and/or have someone monitor the input frequency or go to simplex to get better idea of how well you're getting out with different antennas. Or find a large open field (high school athletic field?) and run field strength tests.

If your feedline is RG174/LMR-100, replace it with something larger/less lossy @ VHF and more rugged - I have not had good results with the subminiature coax and connectors holding up, even with strain relief. YMMV. The weight difference between 174 and quality 58 or even 8x is minimal compared to the radio & battery.

Now if you want to try that amp:

Scott also said:
> The battery will discharge pretty fast with 35W output. I imagtine a 30 minute rag chew will bring it down to the threshold voltage. You'll need to be selective on how long you use higher power.

Try running the HT at reduced power, will lower the output and current draw of the amp. If you can place a power switch where you can easily reach it to turn the amp on only when you need it.

For a bike-friendly battery, look at:
http://www.batteryspace.com/search.aspx?find=water+bottle Available in NiMH and several Li-based types, with or without charger, plugs, etc. I really like this packaging as it lends itself to bike mounting and is inherently protected from the elements. Also got this idea from the GOBA radio folks. Have not used it myself yet but thinking about it.

I have one of those 35W Mirgae amps, too, and have thought about using it on a couple of local century rides where I am bike mobile and have problems being heard in several spots due to hilly terrain and distance. For infrequent use like that, I'd probably mount the amp inside the frame triangle (suspend under the top tube?), use a freezer zip bag to protect the amp, run it only when necessary, and keep my transmissions short. Or, maybe mount the amp in the bottle cage that holds that seat-back Larsen 1/2 wave (protected with a baggie) and use a batteryspace bottle battery in the other seatback cage. If you are using a pannier, rack trunk, handlebar, or large seat bag, see if it gets too warm when kept inside.

For more permanent weather protection, I'd look for a small plastic box (pencil box, or maybe one of the smaller Pelican or Otterbox models) about the width and height of the amp, with depth between the amp body and the heat sink. Cut a hole in the lid for the heat sink fins, and find something weather proof (thin rubber hose? adhesive-backed foam window winterizing insulating strips?) to form a gasket.

Good luck - tell us how it works out (and post pictures!)

Topic: 2634 Message: 2640

I have one of these dual-band Mirage amps... and I have used it on my bike.

The manual says its 45w on 2m and 35w on 70cm and draws about 7A on transmit. When feeding the amp with 5w... I've measured 50w out on 2m and 35 out on 70cm and I've measured about 7.2 Amps of current draw. I usually feel the amp with about 2.5w and get about 30w out on 2m (don't use 70cm that much) and the current draw is about 5 Amps. I have an older Mirage B23 (2w in/30w out) 2m only amp which is only suppose to draw about 4 Amps... but for some reason I'm only measuring about 15w out on that one (into a dummy load).

I have a bag on top of my rack that I put the amp in as well as the battery that I made for it. I made up a battery for the amp using ten 10,000mAh D cells. I have a piece of coax that goes from my handlebar to the bag and then a piece of coax that goes from the bag to the antenna. All of the coax has BNC connectors on them. I used a couple of UHF to BNC right-angle adaptors that I bought thru MFJ. When I'm not using the amp... I use a BNC barrel connector to put the two pieces of coax together.

When I use this amp... I try to keep my transmissions as short as possible... to help conserve the battery. I guess a cheaper way to go to increase battery capacity would be to get a couple of 7Ah to 10Ah sealed lead acid batteries and put them in parallel... but then that would add a LOT of weight to the bag and back of the bike.

From: Jack Smith
Topic: 2638 Message: 2641

For my bicycle touring uses, headlight, taillight, etc., I'd been using the energizer rechargeables, but I found that the Sanyo's last much longer than the energizer and are more compatible with devices. For example, in a couple of my HT's that can use battery packs the Sanyo's power them just fine. However, the energizer ones will RX fine, but will cause the radio to shut down under the load of TX. The good news is they can use the same chargers. I carry the energizer fast charger and recharge wherever someone will let me plug in for a few minutes. Usually I can ask folks at a C store to borrow an outlet as long as I'm buying something. I'll have to look at the pricing for the new Eneloop Pro ones and see if it's worth the difference. For long, single day rides, I think it would. For touring, probably not.

I also use those in my Byonics MT-AIO for "bicycle mobile". While they're not the lightest solution, the price and ability to recharge quickly has made me a believer. Also, the ability to swap over to conventional batteries in an emergency is also a plus.

That's what I have. It's a dualbander but 1/2 wave at 2m. I have a NMO automobile mount and drilled a hole through the bike rack so it attaches over the rear wheel. Works well, though I have to be careful how I swing me leg when I get off ;-)

I don't know what the feedline is - it's something fairly thin. Maybe RG-8X or RG-8U? (I forget all that cabling option by now..)

But it only runs a few feet so I don't think the loss is very significant or even measureable. My HTs have SMA connectors so there is a 2ft SMA-to-SO239 cable at the very end.

Very interesting. Do you have particular preferences for type (NiMH vs. LiIon, etc)?

Hmm, let me see if I follow. You're suggesting that the heat sink is waterproof itself (I need to check and make sure there aren't screws in it), so I could let it stick out the top of the box and seal up the edges? That's an interesting idea.

If the cable looks like "normal" thickness, it's RG58 or 8x - ~0.2 in for RG58, 0.242" for RG8X. Most antennas and mounts that come with coax use RG58 - Larsen uses -58 for their NMO mounts. RG174 is about 0.100" diameter. Every commercial SMA-to-SO239 cable I have uses 174 or an equivalent. I agree the loss is minimal, my problem is mechanical reliability at the connectors. I have much better success making connectors for RG58 than I do with 174-size, anyway. (That may be part of my problem, too!)

> Very interesting. Do you have particular preferences for type (NiMH vs.
> LiIon, etc)?
>

Not really - NiMH is cheaper, heavier, and no surprises, works with the chargers I own. The lithium battery is lighter (significantly), more expensive (ditto), and requires more care in recharging. If I bought one, I think I would start with the NiMH version (unless weight became an absolute premium to me) and decide after some use if I needed more run time that LiIon would provide.

Hmm, let me see if I follow. You're suggesting that the heat sink is
> waterproof itself (I need to check and make sure there aren't screws in it),

I took a look at my LA-2035R and there are bolts and 2 ventilation holes in the heat sink area. So I don't think my original idea would work. I would look instead at ways to protect the amp from direct water spray while providing some passages for airflow and keep transmissions/duty cycle down. Or only use it on dry days.

Photos of the current setup:
> http://www.flickr.com/photos/**jgoerzen/5788644310/in/**photostream<http://www.flickr.co

> http://www.flickr.com/photos/jgoerzen/5788643372/in/photostream
>

Nice set up. I just moved my mount from a mirror mount on the side of the rack to an aluminum plate bolted to the underside of the rack extending a few inches behind the rack. Gives me better mounting for a pannier where the mirror mount was and keeps the rack top clear for a trunk bag or other use.

Oh you betcha, Dave. Never miss a FD, 1C on the bike ... not since 2000, anyway. Looks like the Chicago area is going to have some decent wx for a change - not so fast - 40% chance of showers on Sunday AM. OK. I stand corrected. Get your stuff on the bike, Dave and we'll see you on FD.73,Ron W9XS

I hope to be out in a local park with the ICE Trike and my communications trailer. I have done this for the last few years and usually run at least a couple of hours. I will be running CW only with the FT-817 and a new SuperAntenna MP-1 antenna. Will post pictures.

Those who run Field Day with their bicycle mobile, please post pictures if you can.

2651. W0R Special Event call for RAGBRAI

Yahoo group: BMHA
Date: 2011-07-22 14:08:31 UTC
From: Mike
Topic: 2651 Message: 2651

I will be with Team Megacycles for RAGBRAI again this year from July 23-30. I am with the SAG crew this year rather than riding so will have a little more time to operate. We will be using W0R as the special event call. Look for us on the QRP frequencies and other frequencies as we travel across the state of Iowa. We hope to use the call as bicycle mobile at times and sometimes from the truck mobile.

QSL's to me, NF0N, SASE please.

73 and hope to work many of you this year from RAGBRAI

That is a catchy name.

When I was in electronic school back in 1956 no one, at least to my knowledge, had ever thought about bicycle mobile. However, there was a poem telling of Reddy Kilowatt's adventures. He often rode his megacycle over the Wheatstone bridge, that spanned the eddy currents, in order to visit his girl friend Milliwatt. On stormy nights he often had difficulty seeing and had to Probe his way home.

Fun stuff. I'm sure I'm not the only one who knows about this rhyme.

2654. Any experience here with LiFePO4 batteries?

Yahoo group: BMHA
Date: 2011-07-25 19:50:01 UTC
From: BrassRat77
Topic: 2654 Message: 2654

After posting in an earlier thread about trying to mount an "HT booster" amp on a bike, or not, I think I've figured out a way to mount my Daiwa amp with acceptable weight and mess on my road bike. This is for comms support for a century ride with 6-7 hrs riding time, APRS beacons every 2-3 minutes and voice as needed. Comms are on VHF simplex and much of the route is hilly & far enough from net control and rest stops to be too far for a 5W HT even with a good antenna.

Next step is how to power it. I'm looking at the 12.8V, 6600 mAH pack in a 500ml water bottle from batteryspace.com. It's pricey (!), but I like the specs - weight and capacity in particular. I'm concerned with the 15.6V peak spec, wonder if it's a mis-type. Individual cells are 3.6V max after charging, 14.4V max for a 4S2P pack. I've emailed them about it. Maybe someone here has 1st-hand experience with this battery chemistry or with this particular pack.

Batteryspace also has a much cheaper 12V 4500 mAH NiMH battery in a 500ml bottle. This pack is limited by polyswitch to 4.2A max, which is close to or less than what the amp draws if I forget to keep my HT at low power and run 4-5W to the amp. If the switch self-resets, I should be able to recover once I spot the mistake.

I want the capacity of the Li pack about once a year; 4.5 AH is plenty the rest of the time and even for the upcoming century if I run the amp only when needed. I may already have a suitable charger I can use for the NiMH.

I am using a 7AH 12V SLA on my commuter to test things, but I don't need that capacity normally and the size & weight are more than I'm going to accept on a hilly century ride.

To mount the amp, I plan to strap it (large hose clamp + heavy-duty zip ties for secondary stability) to the water bottle and it will stay put in my behind-seat holder, with a cut-up plastic box as a rain shield for the amp. I made a proof of concept over the weekend with an old water bottle. "Plan B" is a small handlebar bag. Either way, I need to pick one battery or the other or skip the whole idea.

Comments/Suggestions?

73 Steve KS1G

2655. Follow up: Initial observations Re: Any experience here with LiFePO4 batteries?

Yahoo group: BMHA

From: BrassRat77
Topic: 2654 Message: 2655

Follow-up: I ordered the 6.6AH battery-in-a-bottle from batteryspace.com. Battery arrived yesterday (ground-ship only, apparently Lithium-anything is hazardous cargo).

The water bottle packaging is the same diamter as a "standard" bike bottle, a little shorter than my 700 ml bottles with straight sides. I have not tried opening the bottle to inspect the battery pack so I cannot comment on the pack's construction. I have to assume the pack has a control/cell balancer board inside, as there are only the 2 charging leads accesible from outside the pack.

The charger needed approx 3 hours to charge the battery from an unknown but rpesumably discharged state. I did not measure the voltage beforehand, it was 13.6V topped off.

The power cable comes out the moutpiece; a heavy insulated coil terminating in a female axial connector. The axial connectors are water resistant. I bought a male connector cable with bare leads. Use a sharp knife to trim away more insulation if you need it, and BE CAREFUL or you'll cut the insulation on the leads. Didn't measure the lead gauge but 30A power pole pins crimp on just fine. The total cable length reaches with slight stretching from a behind-the-seat water bottle holder to a small handlebar bag where I've placed the amplifier.

Battery has plenty of capacity to power a nominal 30-35W "ht booster" amplifier (Mirage B23). Tried it on this morning's commute. No reports of signal distortion, time will tell regarding overall run time. 30W makes a huge difference vs. 4-5W with a bike-mounted antenna. This should handle filling in coverage gaps quite well. I think it would also work really well powering an FT817 and HFPacker amp.

The battery + bottle + attached cable weighs 1 pound 14 ounces (850g). This is comparable to one of my 700ml water bottles (filled) @1 pound 10 oz (737g). Versus a 7AH SLA at 8 pounds (3,629g). Guess which battery I'd prefer carrying around 100+ miles and 5,500 ft of climbing?

You do get what you pay for. I saw an example last Sunday of one of the A123 packs buddipole sells. (I think it was the 4S1P model) Nicely made, owner was very pleased using it for SOTA and backap ops. But a bit pricier than the batteryspace unit.

Steve, I tried going to batteryspace.com and they show NOTHING in a 12 or 13.6-volt 6.6 aH li-ion battery. They show 3 different models of bicycle bottle-replacement batteries, all 11.1 volts.
Can you provide a link to the one you bought? Hopefully they haven't discontinued it already??

2657. Follow up: Initial observations Re: Any experience here with LiFePO4 batteries?

Yahoo group: BMHA
Date: 2011-08-15 18:45:01 UTC
From: BrassRat77
Topic: 2654 Message: 2657

Certainly! I may have mis-spoke the voltage spec, making it harder to locate the battery I purchased. Start here: http://www.batteryspace.com/128lifepo4packsforbikelight.aspx <http://www.batteryspace.com/128lifepo4packsforbikelight.aspx> . The 11.1 V batteries are different from what I have.

What I bought: http://www.batteryspace.com/waterbottlelifepo4battery128v6800mah8704whfo\rhidhalogenbikelighttrial-techfemaleplug.aspx <http://www.batteryspace.com/waterbottlelifepo4battery128v6800mah8704whf\orhidhalogenbikelighttrial-techfemaleplug.aspx> . The bike-bottle packaged systems are at the bottom of the page. I purchased the charger, male connector to bare wires (I added powerpoles), and male connector to alligator clips for less than the complete package.

Their "complete" package: http://www.batteryspace.com/waterbottlelifepo4battery128v6800mahtrail-te\chfemaleplug82wh30achargertrail-techmaleplugforhidhalogenbikelight.aspx <http://www.batteryspace.com/waterbottlelifepo4battery128v6800mahtrail-t\echfemaleplug82wh30achargertrail-techmaleplugforhidhalogenbikelight.aspx\>

This looks like the same battery in different packaging - may be a better deal for some folks: http://www.batteryspace.com/LiFePO4-Belt-Bag-Bike-Battery-12.8V-6.6Ah-84\-Wh.-14A-rate-Charger.aspx <http://www.batteryspace.com/LiFePO4-Belt-Bag-Bike-Battery-12.8V-6.6Ah-8\4-Wh.-14A-rate-Charger.aspx>

This may be the battery pack they are using in all the above products: http://www.batteryspace.com/LiFePO4-26650-Battery-12.8V-6.8Ah-87Wh.-14A-\rate.aspx <http://www.batteryspace.com/LiFePO4-26650-Battery-12.8V-6.8Ah-87Wh.-14A\-rate.aspx> Interestingly, it's cheaper right now packed in the bike bottle.

Allow extra time for delivery - I placed the order on 7/28 and the battery arrived 8/11. I attribute much of the time to the restrictions placed on shipping Lithium-anything batteries, even though I understand the iron-phosphate types do not have the fire & explosive risks associated with other Lithium-ion chemistries. The packaged was well-packed and complete. The battery required about 3 hrs to charge, so I assume it is shipped in a relatively discharged state. I did not measure voltage before charging. It was about 13.6-13.8V (forget which) when charged. The battery did not feel warm during charging, while the

charger did become warm (but not uncomfortably hot). The bottle packaging appears to provide good protection for the battery from weather and dirt. The cable is heavy duty; the conducting wires are embedded in the insulation, requiring a sharp knife and some care to strip further than how it comes from the vendor. I did not try opening the bottle to see how the battery is packaged internally- I suspect the bare pack linked above is what they are using.

I used the battery to power my VX8 during an 80 mile, 5.5 hr ride yesterday. My VX8 was set to send an APRS position report every 2 minutes (approx 165 possible reports). DB0ANF recorded 79 position reports, a pretty good success rate considering the traffic levels in the Washington DC region, terrain, etc. The VX8 was set to L3 (2.5W) output, this should produce about 25W from the amplifier. The battery showed no signs of droping off after this use as well as about 1.5-2hrs of use on APRS and some voice during my commute on Friday. No-load voltage was 13.2-13.3 V after the ride. I have not had an opportunity to track battery voltage, current, vs. time and amplifier drive/output level but hope to before next weekend.

I experienced only one problem with the battery during the ride - - while water resistant, the trail tech connector will not stay connected if subjected to even small amounts of tension and requires some strain relief to keep the connector mated. The two ends of the cable should be secured to the bike anyway to prevent a loose cable from getting caught in the drive train or wheel (unlikely but why take chances?) Because of the disconnects, I'm not sure yet if the remaining coverage gaps were due to the amplifier being off, and which are places that will just remain problems. Either way, I think I will have respectable voice and APRS coverage given the limitations I've placed on using a road bike as a radio platform.

Look on aprs.fi for KS1G-7 on Aug 14 2011 <http://aprs.fi/?call=a%2FKS1G-7&dt=1313280000&mt=roadmap&z=11&timerange\ =3600> (or db0anf.de) to see how it looked. Following the century ride this coming Sunday, I plan to try the battery out with my FT817 and HF Packer v3 amplifier.

Yeah, David. Good idea.
I usually get out for rides in the mid afternoon local time which would be around 2000 UTC. By that time it's a little late for you and I've noticed that the band closes down to EU from here a few hours before that.
What would be the best time for a Q?
Nothing new in the way of radios here and still putting in only 50 miles a week or so. I'm semi retired now and find that I am doing more wood work than I anticipated. Every time I build something the adult kids say "Hey, can you make one of those for me?" Finishing up my sixth Adorandak chair and third table so far this season.
I had more free time to goof off when I was working full time :-)
Let me know what times and days work best for you and we'll set something up/

Hello Ron,

I think September will be a better month for propagation between us in the afternoon.

I can get out out at about 1800 - 1900Z if you can make it?

Like you I am looking for some early retirement this year and I have heard many people tell me they have less free time retired than they had working!

Now about those Adorandak chairs ..... can I make my order now?

Speak soon

Dave G4AKC

2661. Post-century report - Batteryspace LiFePO4 "water bottle" pack

Yahoo group: BMHA
Date: 2011-08-23 15:22:47 UTC
From: BrassRat77
Topic: 2654 Message: 2661

This is my final (hopefully) follow-up on my use of the batteryspace.com LiFePO4 battery pack in a water-bottle <http://www.batteryspace.com/waterbottlelifepo4battery128v6800mah8704whf\orhidhalogenbikelighttrial-techfemaleplug.aspx> to power a 30W HT amplifier for a 106 mile century (Reston Century, Reston Virginia; check the usual APRS internet sites for KS1G-7 on 8/21/2011 for details.)

Summary: Worked great. Absolutely no power issues. I like this battery. Looking forward to trying it with FT817 & HF packer amplifier. All connections stayed sufficiently dry including riding in a full downpour for the last 2-3 miles (could not quite beat the rain!).

Details: Battery pack is mounted in a seat-back (tri-geek style) water bottle holder. Inverted the battery to shorten the cable run a few inches and theoretically improve weather resistance. (Could also use seat tube or down tube bottle cages, and I think an underside down tube mount would work if your frame is big enough for a large bottle in that location.) Multiple velcro strips (cable management from retired APC UPS's) held power cable to bike frame top tube & kept the "TrailTech" connector together. (Could have used zip ties or tape.) Terminated male connector with 30A PowerPoles. "What's Up" to monitor battery and spliiter cable to power amplifier and have power available for VX8 HT if needed. All power pole connections used retention pins to keep things together and were inside the small handlebar bag holding the amplifier to keep them out of the weather.

I ran the VX8 at "hi" power off internal battery (~4W) resulting in 30W+ amplifier output, 5-6A draw on transmit. "Idle" current during receive (amplifier on but not used) ~ 0.1-0.2 A, 0.5A if HT connected/charging (not used for ride). APRS beacon was every 1-2 minutes (reduced to 2 min for about 25% of ride). Occassional voice ops. Turned off HT for longer rest stops (left battery connected). Ride time was 06:32, total time 07:54. Estimate ~ 7 hrs total use of HT (with APRS active).

The off-charge voltage was a bit over 14V but quickly drops to the 13.5-13.8 range. At the end of the ride, battery voltage was 13.25V during transmit and 57.3 WH had been used according to the Watt's Up. Battery is rated 84WH, so plenty of capacity remained. No indication of any battery sagging on transmit. Battery weighs slighty more than a filled 24oz/700 ml bike bottle; I consider this an acceptable penalty for a moderately hilly (~4,500 ft of climbing) century to get reliable power sufficient for the day's use. [In contrast, a 7AH 12V SLA weighs 5.5 - 6 pounds.]

The charger works well; it gets warm when plugged in so I would not recommend leaving it powered when not in use.

The only improvement I would like to see / might make myself is replacing the weather-resistant cable connector shipped by batteryspace with a locking weather-resistant connector.

I have not tried opening the bottle to look at the pack construction & packaging. I suspect they use the same pack as here: http://www.batteryspace.com/LiFePO4-26650-Battery-12.8V-6.8Ah-87Wh.-14A-\rate.aspx <http://www.batteryspace.com/LiFePO4-26650-Battery-12.8V-6.8Ah-87Wh.-14A\-rate.aspx> . FWIW, this pack is $10 more than the version packaged in the water bottle.

73, Steve KS1G

Carl,

Great job from the bike and nice video's ... we must arrange a bike to bike sked?

Regards ...

2665. Chameleon V2L Mounted on a Bicycle Stored on a Balcony

Yahoo group: BMHA
Date: 2011-09-10 05:19:11 UTC
From: CarlL
Topic: 2665 Message: 2665

Chameleon V2L Mounted on a Bicycle Stored on a Balcony

The bicycle was located on the balcony at the second floor.

HF Power = 100W

This video shows a simple bicycle antenna setup. The V2L is grounded to
the bicycle frame and to the aluminum patio door to reduce the RX noise
in the transceiver.

Frequency operated:
40M

2667. Biking Cross Country

Yahoo group: BMHA
Date: 2011-11-30 16:26:21 UTC
From: ki4jgt
Topic: 2667 Message: 2667

Hey guys,
This is KI4JGT. I was wondering if someone could give me all the information I needed to mount a bicycle with a 2 meter radio. I'm wanting to bike across the USA (from Kentucky to California and several places in between; niagra falls, mount rushmore, grand canyon, world trade center) I'm going to practice all Winter and then finally when the first day of summer comes along, I'm planning on leaving. I want to stay in one place about 2 days then leave for my next destination. I'm getting a job to buy supplies (so far: 2 M Radio, Bicycle, Palm/handheld device for photos/blog uploads/GPS/Wifi/finding places to stay/using paypal to pay for things) which I'm thinking would add up to around $500 dollars. I'm going to take an extra $500 for spending money with me. I'm also hoping to find sponsors and such, maybe even someone who will employ me to take the photos. Would any of you know of any other ideas I haven't considered? (I know there's bound to be tons) Please drop me a line and let me know. Thanks 73 DE KI4JGT.

Try looking at the index of past BMHA newsletters -- there are a number of articles on this and similar topics.
http://bmha-hams.org/Newsletter/NewsletterIndex.asp

Most people put an antenna on the back rack -- I personally prefer the antenna on the handlebars as I find it easier to mound/dismount without kicking the antenna.

Look through recent newsletters to find descriptions of past built rigs.
I prefer the antenna on the rear of the rack because I don't want
something poking my eyes out as I ride. Besides It's my brain I don't
want to irradiate with the RF.

I'm not sure you've considered routing, but a first stop is Adventure Cycling Association (http://www.adventurecenter.com/cycling/?gclid=CICZs6ua36wCFY3JKgodRSSzpQ#.TtaTDmPNlGU).

They started out as BikeCentennial. They have maps and lots of information on all aspects of cross country cycling. I used their maps to ride a portion of the "Great River Road" along the Mississippi. You'll find it easier to pedal from west to east, putting the prevailing winds on your back.

You didn't mention luggage for your bike. That's a complete study in itself.

Radio - 2m H/T not a bad choice. You may want to consider one that uses disposable batteries because you may not have charging power when you most need it. Take enough water for more than a day's need, just in case!

Have you done any long distance cycling in the past?

I attached a piece of aluminum to my bike rack so the antenna mount is about 13 inches beyond the end of the bike rack. I've had it on my bike for about 1 1/2 years now... and I haven't kicked my antenna yet.

I have a Topeak Explorer Tubular Rack and a Topeak Trunkbag on the rack With the antenna mount being about 13 inches beyind the end of the rack... I can slide the trunkbag off of the rack without having to take the antenna off of the mount (I made sure the aluminum I used was long enough so I could put the trunkbag on and off without having to remove the antenna).

From: William Schmidt
Topic: 2667 Message: 2672

You might consider a J pole antenna made from twin lead http://www.kb3kai.com/j-pole.php
You can use a fiberglass flag pole on the back of the bike to hold it up. Being a half wave design it doesn't need a ground plane and when you stop you can throw it up into a tree for greater height and coverage (which I believe you will need out west).
My friend just biked from Ct to Washington along the northern route. He really liked the adventure cycling maps. They detailed camping places, food sources and bike shops. He spent $5000 on the trip. Even campgrounds charge a fee so $500 sounds too little.
I would recommend taking several shake down rides to be sure your equipment is good.

From: Jay Baack
Topic: 2667 Message: 2675

I second a lot of what has been said here. Having cycled from Canada to Key West Florida, $500 is about 5 times too low at a minimum. Figure at least $20-25 for food a day, which is on the cheap, if you are concerned about miles per day and not leisure touring. Where you are riding and taking days off, the $5000 figure might not be that far off. Town rest days suck money out of pockets very quickly.

Miles: What are you looking as far as distance per day? Where do you plan on staying? The Adventure Cycle maps are great, but they stop and stay at expensive destinations. I would (and have) used them for routing info, but skipped on the stops for other arrangements.
If you plan on camping at parks (ie. A place with a shower) figure $15 a night minimum as well for a bike tent site.

Besides the ham gear, what else is coming? Tent/sleeping bag/ repair kit / food... This all adds up very quickly in weight. More weight = slower travel = longer days = more stress on tires/bike frame..and YOU.

As far as ham gear, two words.
Bulletproof & KISS.

You want rugged gear that works when dropped, banged around and gets wet. I ran a HTX202. Ugly as sin, but worked the entire time, never failed, and I could run it on AAs if I needed to.

Antennas, again KISS. You will bike under trees, canopies, and other obstacles. Keep it simple. I went with a 1/2 wave "through the glass" antenna meant for the back window of a car, and it worked fine. Line of sight was maybe 2 miles and could hit repeaters 20 miles away with 2.5w.
Was it perfect.. NO. Did it work? YES.

You are talking about a long distance trip here, not a weekend 40 mile ride around town. Planning will be the key to wether you finish or not.

Are you prepared to change 4 flats in one day? (trust me it happens).
Or what about 5 days of riding in the rain where everything you own Is soaked?

Know you gear in and out, then start training. Pear down from "nice to have" to "need". Know what foods you can pack and what you can't. Test your skills. Go ride 65 miles when it is hot or cold, then stop and change both inner tubes and ride another 30. If you can do this now, when it happens on the ride it will not be a big deal, and easy to navigate. However, if you have never done it.. And now you are hot and sweaty, or freezing cold, and the sub is going down.... You get the picture.

I am not trying to crush the dream here, rather trying to imply the importance of being prepared ahead of time so the trip will be that much nicer.

Best of luck

Jay N1RWY /7

One thing to consider is mailing stuff to yourself along the route. Long distance hikers do this all the time, and it's a very good way to keep the weight and cost down. You can look up Appalachian Trail backpacking and see how it's done there and get an idea. If you're camping on the road, it's a great way to get resupplied on food and seasonal clothing changes. Having a family member to mail pre-packaged boxes to you on a schedule or when you call them is a great way to make sure that they're their when you get there.

And as has been said by others, weight is the killer! Keep it as light as you possibly can!

Jack

You are talking about a long distance trip here, not a weekend 40 mile ride around town. Planning will be the key to wether you finish or not.

Are you prepared to change 4 flats in one day? (trust me it happens). Or what about 5 days of riding in the rain where everything you own Is soaked?

Know you gear in and out, then start training. Pear down from "nice to have" to "need". Know what foods you can pack and what you can't. Test your skills. Go ride 65 miles when it is hot or cold, then stop and change both inner tubes and ride another 30. If you can do this now, when it happens on the ride it will not be a big deal, and easy to navigate. However, if you have never done it.. And now you are hot and sweaty, or freezing cold, and the sub is going down.... You get the picture.

I am not trying to crush the dream here, rather trying to imply the importance of being prepared ahead of time so the trip will be that much nicer.

Best of luck

Jay N1RWY /7

What kind of a bike do you plan on using? I have done alot of research on this topic. I ride my bike so far 7 day's a week. And 5 of those day's is to work and back 6 miles round trip. Cold wx and wind not much fun, but otherwise ok. I maybee answer some of your questions if you have any for me. Got nmo mount Larsen 1/2 wave antenna mounted to the rear of the bike, a couple of 2.9 ah battteries hose clamped to the rear fender. Got a handlebar mount for a vx-7r, and an ipod,and gps. Can tell you what i like and dislike about what i put together in detail. And maybee what i would do if i was to make that trek across the US.
We can talk about it off line, as maybee some folks dont want to read my long winded boring details. All they way down to what to eat the night before you want to head out like spaghetti. I would like to ride with you if you would like a partner. Would have to take time off work to do it. Any idea on how many miles you want to peddle a day? Some guy's take this stuff really serious and devote thier life to biking, i dont want to get in the way of thier comments and or all that stuff. I think if some funding got arranged for food and hotels you, we, could do it. You dont want to peddle alone do ya?
What happens when we get a flat tire? I got AAA roadside assistance does that apply to a bike also :)

Wow! That has been my dream of a lifetime bike trip! Top to Bottom of the Americas!

I tried to get info on such a trip as that back in the '80s. Contacted National Geographic for any helpful advice. Sort of got the brush off!

Familyonbikes Vogel finished a trip from Prudoe Bay, Alaska to the southern most tip of South America. It took them two years. You can google them. Nancy may have advice.

From: Al Gritzmacher
Topic: 2667 Message: 2678

Some others suggested the Adventure Cycling Association and I'll second that. There are numerous other state and local bike trails, either rail-to-trails type, or roads with cycling friendly improvements that make up suggested routes. Some are good, some not so... Finding out about them is harder too. Some Googling will be required. New York state has a number of highways designated as bike routes. All it usually means is they paved the shoulders and painted some lines before putting up the route markers, but it gets them a lot of Federal money...

I'd suggest checking out crazyguyonabike.com and reading what others have done. Thousands of people have ridden long-distance and many have written about it. You'll find at least several that have done something similar to what you want and get good ideas of what works there.

I think your budget is on the low side. You might stretch it by doing what they call stealth camping, that is finding a hidden spot off the road and camping out each night for free. It might mean begging forgiveness instead of permission once in a while, but can save money. You'll also eat a lot of fast food and stop at convenience stores for supplies rather than eat in restaurants if you want to go cheap. That and eat a lot of camp food.

Another way to find free lodging is warmshowers.org. It's a directory of people who are willing to host travellers for a night or two. It might just be a couch or a flat spot indoors to put your sleeping bag, but the price is right.

Sponsors? You'll need to be doing something really unusual to get sponsored. As I said, thousands of people have ridden coast-to-coast on a bike.

As for radios, simple and rugged was good advice. Personally, I wouldn't want to spend my trip with 2M FM squawking in my ear. I'd stick a HT in my bags for an emergency but probably not ride with it on. I'd find a QRP rig and some wire antennas to toss in a tree while camping more enjoyable. But you do whatever you want, it's your trip.

If you get near Niagara Falls, look me up. I live about 15 miles east of NF. I'm right on the ACA Norther Tier Route, NY Erie Canalway Trail, NY Bike Routes 5 & 517 and can fill you in on all the local info.

2679. Bike tour planning

Yahoo group: BMHA
Date: 2011-12-01 17:27:24 UTC
From: Barry Bogart
Topic: 2679 Message: 2679

Jay us providing good advice. The best advice I can give you is buy this book: http://www.amazon.com/Bike-Touring-Sierra-Outdoor-Adventure/dp/1578051428/ref=sr_1_sc_1?ie=UTF8&qid=1322758547&sr=8-1-spell and read it cover-to-cover.

You COULD do it on a $500 bike, if you knew what to look for. Somewthing like a used Trek 420 or 520 for example. Or if you get a new bike, you could do worse than a Surly Long Haul Trucker. About $25 a day for food is good (you will be HUNGRY). I usually get the bigger trucker's breakfast I can find and patronize
Subways the rest of the day. A mix of camping and motels will average another $25.

Adventure Cycling is definitely worth joining. Their maps are excellent, if perhaps too detailed. I would recommend that you take a GPS (or a smart phone/Palm/Pocket PC). I bought a car GPS (Garmin Nuvi) for my tour through Ohio after Dayton and it was very useful for finding food and lodging as well as routes. But battery power is an issue so you have to do something to address that. I always carry my netbook now. It has map software (Mapsource, Mappoint and Street Atlas) for overall route planning, and it can be used to recharge the PDA and transfer waypoints to it. And it can access the internet, which is your best friend on a trip like this (before and during). I used to use APRS but now carry a SPOT (www.findmespot.com) to let people know where I am. I added their road-assistance feature but haven't tried it from the bike yet!

Read the book, get the
bike, and try riding about 75 miles a day over three days on a long weekend. Try to include one rainy, cold day! A few flat's would be good too. But when you actually get going on your tour, cold rain and flats won't bother you. It's quite magical. Bike tourists do seem to have a guardian angel, but you must prepare. "God helps those..." you know. There are lots of stores onine by bike tourists and they can be quite inspiring. Check out my friends here: www.toddlerontour.com. They learned a LOT on their trip and you can benefit from that.

Let us know before you set off.

Hey guys,
This is KI4JGT. I was wondering if someone could give me all the information I needed to mount a bicycle with a 2 meter radio. I'm wanting to bike across the USA (from Kentucky to California and several places in between; niagra falls, mount rushmore, grand canyon, world trade center) I'm going to practice all Winter and then finally when the first day of summer comes along, I'm planning on leaving. I want to stay in one place about 2 days then leave for my next destination. I'm getting a job to buy supplies (so far: 2 M Radio, Bicycle, Palm/handheld device for photos/blog uploads/GPS/Wifi/finding places to stay/using paypal to pay for things) which I'm thinking would add up to around $500 dollars. I'm going to take an extra $500 for spending money with me. I'm also hoping to find sponsors and such, maybe even someone who will employ me to take the photos. Would any of you know of any other ideas I haven't considered? (I know there's bound to be tons) Please drop me a line and let me know. Thanks 73 DE KI4JGT.

Hello,
It is a beautiful travel plans!
I use a quarter wave with a spring at the base. It is attached to the bicycle frame near the rear wheel.
Maybe you could use a trailer for luggage, attach a half-wave antenna and a small solar panel to recharge the battery from the radio.

From: wd9fyf
Topic: 2687 Message: 2687

I suspect this subject has been worked over in the past, but I probably missed it.

Is there any good solution to this? The GPS receivers I have read about either have no battery operation or not much run time. Likewise, the 2m access needs to have a bit of power. So, is there a sensible solution? I know I would want at least 8 hours run time with good mapping for all those rural roads so I could actually tell where I am.

I don't truly understand why 2m fm radios are used when fsk of a carrier or afsk of a ssb signal would be much more efficient.

73,
Harry, WD9FYF

Topic: 2687 Message: 2688

After having the opportunity to attend several presentations by Bob Bruninga (the father of APRS) I think I can make these statements about APRS and be accurate..

2 Meter FM works well because it doesn't propagate all over the place.. part of the point about APRS is that you want local APRS traffic to stay local. Since GPS location information is only a part of what APRS provides (were you aware that it is a fully functioning bi-directional real time texting service as well?). 2 Meter FM also links in well with the whole digipeater and Internet connectivity scheme.

Also, APRS is a protocol on top of the radio transmission.... I know of locations where they are using 70cm FM for their APRS system. Bob talks about another area in the country where they got a great deal on 6 Meter FM repeater equipment and thus set up a 6 Meter APRS Digipeater network.

I have also worked events where we used a 2 Meter simplex freq for a non-digipeat APRS system (similar to what they do at the Dayton Hamfest from what I have heard.

Getting past all that... What is it you want to do while on the bike, transmit your location via APRS or have a GPS mounted so you can track the roads you are on?

For the latter I use the GPS Mapping feature of my Blackberry on a handlebar mount. Works great although the display on my Blackberry is a tad small... but bigger than many of the Garmin bicycle based GPS tracking systems out there.... My Blackberry will run for about 6 - 8 hours with mapping on continuously and I carry two extra charged batteries with me everywhere I go.

Speaking of which, my wife has a Garmin 500 on her bike and it tracks your routes if you want it to... but the Garmin 700 is a much larger color display and it allows you to upload/download maps and routes directly from your computer to the device (i.e. you can create your route on Map My Ride, save it as a Garmin import file and then import it to the 700 and follow the route you mapped directly). My wife's 500 will go for 10-12 hours on a charge (well, let me put it this way, she's been on rides that have lasted 12 hours, like each day of the STP, and the battery didn't die).

If you are looking to broadcast your location then I would suggest the Byonics Micro-Trak All In One (http://www.byonics.com/mt-aio). It runs on a set of AA batteries (you can use NiMH or NiCad) and will last a week on a single set of Alkaline high power (like the Duracell Electronics batteries) when using the basic broadcast setup.

I suspect this subject has been worked over in the past, but I probably missed it.

Is there any good solution to this? The GPS receivers I have read about either have no battery operation or not much run time. Likewise, the 2m access needs to have a bit of

power. So, is there a sensible solution? I know I would want at least 8 hours run time with good mapping for all those rural roads so I could actually tell where I am.

I don't truly understand why 2m fm radios are used when fsk of a carrier or afsk of a ssb signal would be much more efficient.

Why pick 1) transmit your location via APRS or 2) track the roads
you are on??? Why not do both???

I have an older Garmin GPS V that I can use to track the roads I'm on
AND send its NMEA output to my Kenwood TH-D7A so I can transmit
my location via APRS (and put a freq into the other VFO/memory to
talk on repeaters)

I have Li-Ion batteries in the trunk bag on my bike which I use to power
both the HT and GPS. I could power both devises for days at a time if
I wanted/needed to.

Getting past all that... What is it you want to do while on the bike,
transmit your location via APRS or have a GPS mounted so you can track the
roads you are on?

I have the same setup as Mike with the exception of using a camcorder
battery to feed both the Garmin V and the D7A which are all mounted
together on a cloth carrier slung between a set of tri-bars. see the
newsletter archives for pictures etc.
I may change to Mike's batteries since I am not using the rig enough and
sealed lead acid batteries do not appreciate sitting around doing nothing!

Sealed lead acid is a good way to go... you really can't beat the
price-to-capacity for them. However... going to Ni-MH (making up
a battery back with 8 to 10 D cells) or going to Li-Ion will most likely
cost more for the same capacity... but cuts down in weight.

Some of the people in the Yaesu FT-817 group have bought and
played around with some of those Li-Ion batteries from China on
eBay. You can get 9800mAh batteries and other sizes... but they
don't live up to their claimed capacities.

if you get 5000mAh out of the 9800mAh battery back... still a lot
lighter than a 5Ah sealed lead acid battery and probably cheaper
than buying 8 to 10 D cell Ni-MH batteries to make a pack of the
same capacity.

Actually, think a bit longer on your own question. Since FM-AFSK, FSK, and AFSK of a SSB transmission are ALL full power, carrier on full time when transmissions are made, there is no efficiency difference between any of them.
FM radios are, of course, used most often since they are numerous, available, cheap, and work well for the application. What's not to like? It could be accurately argued that FM/AFSK occupies a wider bandwidth, but band crowding has not been a problem in the ham radio world for the last 20 or so years. 144.39 is arguably the most populated and overcrowded frequency in the western hemisphere, BUT the system works marvelously well, with a large percentage of traffic getting to its intended destination. You can monitor the channel with your speaker or watch all the nonsensical beacons filling up your APRS/Packet screen all day and all night, but who cares? None of us have to listen to it or watch it to enjoy the use and utility of this multi-purpose channel. We let our microprocessors deal with the congestion and they do it without complaint.

2693. K4BQN Introduction

Yahoo group: BMHA
Date: 2011-12-14 15:53:47 UTC
From: Edwin R. Cortes
Topic: 2693 Message: 2693

Hello Everyone,

This is just a short intro and also a thank you for this forum. I have been searching for a place to find more information about bicycle mobile and I think I found it here.
My name is Ed and call is K4BQN, I live in Palm Bay, Florida and having a Ham for over 30 years. I enjoy the digital modes, camping and riding my Trike.

I have a TerraTrike Path 8 speed, we do not have many hills here in Florida. I have an all ICOM station, operating HF, VHF and UHF. I have a few antennas that I can use depending on what I am doing, AH_703, Buddipole, Alex Loop and many more. I am in the process of researching a better mode of powering my station. At this time I'm using a 4.5 Ah NiMH battery and is ok for short rides, but I will like to take the trike on extended tours and I'm thinking at any available options.

I presently use the LC-156 back pack to carry the radio and accessories, but I am looking for better ways to carry the radio.

I just created an album and uploaded some pictures of my trike. I hope you enjoy them.

Thank you and 73's

I am a bit green and wet behind the ears with APRS, so my questions are likewise. How does anyone (ie, me) learn the locations of these "digipeaters" so one could track a bicycle mobile. There are places this bike could go that is NOT urban. I live in Kankakee, IL (60901) and cycle to Danville, IL (61832), neither of which are high population densities and so, the points between. Likewise, I'm not interested in carrying a high power 2 m mobile radio. I appreciate all the helpful comments thus far. I have my eye on the TT4 system, but it doesn't have the operator display for my own use, unless I missed something. In the 01/2012 QST, there is a review of a new GPS unit, that could use the TT4 to connect with the APRS world.

If I read it correctly, the TT4 is a TNC that can be used for other digital interfaces, such as PACTOR, AIRMAIL, etc. That would be great --- more bang for the buck.

Thanks again, group!

73,
Harry, WD9FYF

Subject: Re: [BMHA] APRS and Bicycle Mobile

After having the opportunity to attend several presentations by Bob Bruninga (the father of APRS) I think I can make these statements about APRS and be accurate..

2 Meter FM works well because it doesn't propagate all over the place.. part of the point about APRS is that you want local APRS traffic to stay local. Since GPS location information is only a part of what APRS provides (were you aware that it is a fully functioning bi-directional real time texting service as well?). 2 Meter FM also links in well with the whole digipeater and Internet connectivity scheme.

Also, APRS is a protocol on top of the radio transmission.... I know of locations where they are using 70cm FM for their APRS system. Bob talks about another area in the country where they got a great deal on 6 Meter FM repeater equipment and thus set up a 6 Meter APRS Digipeater network.

I have also worked events where we used a 2 Meter simplex freq for a non-digipeat APRS system (similar to what they do at the Dayton Hamfest from what I have heard.

Getting past all that... What is it you want to do while on the bike, transmit your location via APRS or have a GPS mounted so you can track the roads you are on?

For the latter I use the GPS Mapping feature of my Blackberry on a handlebar mount. Works great although the display on my Blackberry is a tad small... but bigger than many of the Garmin bicycle based GPS tracking systems out there.... My Blackberry will run for about 6

- 8 hours with mapping on continuously and I carry two extra charged batteries with me everywhere I go.

Speaking of which, my wife has a Garmin 500 on her bike and it tracks your routes if you want it to... but the Garmin 700 is a much larger color display and it allows you to upload/download maps and routes directly from your computer to the device (i.e. you can create your route on Map My Ride, save it as a Garmin import file and then import it to the 700 and follow the route you mapped directly). My wife's 500 will go for 10-12 hours on a charge (well, let me put it this way, she's been on rides that have lasted 12 hours, like each day of the STP, and the battery didn't die).

If you are looking to broadcast your location then I would suggest the Byonics Micro-Trak All In One (http://www.byonics.com/mt-aio). It runs on a set of AA batteries (you can use NiMH or NiCad) and will last a week on a single set of Alkaline high power (like the Duracell Electronics batteries) when using the basic broadcast setup.

Topic: 2687 Message: 2695

The beauty of APRS is that you, the user, do not have to concern yourself with where and who the digipeaters are. If you set up your beacon path to WIDE2-2, for instance, if ANY aprs digi hears your beacons, they will be relayed at least twice, ensuring a high percentage of your position reports will be heard (and transferred to the internet) by various Igates which exist all over the country.
So instead of worrying about "a digi to look for", all you have to do is look up a desired APRS callsign via any number of online tracking services which "mine" the APRS server data stream for position reports and other datum.
My favorite such site is http://aprs.fi
And to quickly search for a callsign to see if it's out there in the APRS-Sphere just add the callsign to the end of the URL address like so:

http://aprs.fi/w5aox-6 (My bicycle-track, current up to the recent freezing snow and rain of the last 10 days)
Or, if you have been transmitting positions using the call wd9fyf-9, try
http://aprs.fi/wd9fyf-9

I doubt you're going to be able to see or read the display on a TT4 while in motion; it's difficult for me to even seen the GPS display while riding although I DO occasionally try to glance at it, especially if in strange territory.
The important thing to watch for when considering a GPS unit for APRS use is to make SURE it has the ability (and the connector, whether USB or serial) to output NMEA serial data so it can be used by your APRS system. I find that few of the newer GPS devices do any such thing, while it is common in the older GPS units such as Garmin 18, Delorme Tripmate, and most of the puck-type units withh no onboard display. Byonics.com and Argent both sell such pucks at relatively decent prices. My current setup is an Argent data systems OpenTracker II (OT2) (costs the same as a byonics TT3, with more features such as onboard temperature and input voltage reporting, interesting data for a bicyclist) getting its GPS data from a Garmin 350 (available commonly for $50 + or - used on Ebay) - using another Argent device, the garmin translator cable interface (https://www.argentdata.com/catalog/product_reviews_info.php?products_id=113&reviews_id=102&osCsid=33509616186bba966e60a6b97f5a14ee)
My advice is to spend a hundred or so bucks and get your feet wet with aprs. It's fun and addictive, especially for a cyclist.... I started out cheap and now probably have $1000 worth of APRS systems in all my vehicles, including bicycles and backpacks. But even if you only have ONE aprs system and move it from bike to vehicle etc. it will surely be great fun for you (and for your fam to monitor when they want to see what their crazy relative is doing on his bike currently).

I am a bicyclist so I use a cloth sling between tri bars on drops. If you were to come to Dayton for our forum on Sunday morning or the Saturday ride you might see some alternatives the trike riders use. One I remember is a box mounted to the main tube by the rider's legs.

As far as power, I was just reading an article about lighting and hub generators were mentioned. It seems Germany mandates hub generators for bicycles so they have developed some high quality generators with very low resistance when supplying power and next to no resistance when not active.
They also are capable of providing power for the lights when stopped for a period of time (Capacitors?).
Sounds like one of those with a charge controller and a relatively small battery would be great when moving. That will not work if bicycle mobile means transporting your radio to a spot and sitting and operating for an extended time.

Bud of Buddiepole had his radio mounted in a basket on his Florida style trike when he was a speaker at our forum (He is a bicyclist).

Good luck, hope to see you at Dayton.

Edwin and Norm,

I own a Sun Trike. I have two lead batteries mounted beneath the seat that are wired in parallel. I run an MFJ-9420 and send 7 or 8 watts to a ham stick tuned so that the match box stays home. I use an old World War II Jeep key that clamps to my thigh. I enjoy the trike because it provides a place to set because I don't do CW well on the move.

2698. APRS for Bicycle Mobile (Or any mobile use)

Yahoo group: BMHA
Date: 2011-12-15 02:12:37 UTC
From: Norm Huber
Topic: 2698 Message: 2698

There are three things a number of things you can do with APRS:
1 Send short text messages.
2 Send your position to local stations or internet connected individuals.
3 Receive local operator's position on your GPS's display

The equipment needed to preform these functions is of course different.
Text requires a keypad on the mike and a display.
Just about any GPS/radio device will send our position to the APRS
network fairly efficiently.
When I am supporting a charity ride from my motorcycle I would love to
see where the other support stations were in relation to me and the
route. That is becoming harder due to the fact very few GPS's still
support NEMA strings and support two way communication with the radio. I
may be forced to get a mount for my cell phone and use APRSdroid to
display the stations around me.
As far as power, the antenna is still the key to getting out. There are
lots of ground independent antennas out there, pick one and tune it
correctly.
Good luck. Maybe we will end up with tablets and an app to interface
with our radios. Sure would give us a great size display.

Exactly. SLA has the best WH/$, Li-Ion the best WH/lb (or kg), NiMH is somewhere in the middle. Now depending on what the OP wants to do:

- save a track of the ride to use later with mapping software, ridewithgps.com, strava, etc. - a gps data logger (no display), GPS-enabled sports watch or bike computer, or a GPS-app on a smartphone. All but the phone should easily last a long long day in the saddle without external battery. I have a Garmin 500 (bought it for other reasons than GPS) and it works quite well for logging ride data to look at later.

- real-time position display (Navigation, where am I?, etc.) - some sports watches, pricier Garmin bike computers, the phone, a regular GPS receiver. The ones made for backpacking run longer and have logging functions, automotive have better displays but would be very unhappy if rained on! External NMEA output needed if also used for APRS.

- tracking via APRS network. If the OP wants a usable map of where he rode for later use, a log from one of the internet APRS sites or his home system is not going to be very usable unless there are few turns on his route and good APRS coverage where he's riding. Several weeks of almost daily testing on my bike commute established some serious power and antenna work was needed to get that level of coverage, and this is in a very well-covered (although lots of packet collisions) area. Kenwood & Yaesu HTs are the most compact; any 2M HT and a Byonics TT3 (tracker only) or TT4 (2-way) will work. A decent antenna (minimum for me as a 1/4 wave on a 3/8 mount fastened to my bike rack, flagpole j-pole and Larsen HW-1 1/2-wave were much better) better than a whip on the HT will be needed. Except for the Kenwood & Yaesu APRS-aware HTs, displaying APRS or position in real time will be a challenge. The HTs will run for several hours, at least, on their internal battery; and building an external pack as several folks suggested (or carry a spare HT battery) is easy enough. AA NiMH and single-use Li have 2500-2800 mAH capacity which is much more than the typical HT battery.

- Power. I experienced a HUGE difference running 15-20W (small 30W VHF brick amp) vs 5W, much more than the difference between a big antenna and a 1/4-wave. If the amp would have keyed at lower power, I'd have tried 10W. Depending on location & coverage, YMMV. I used a 7AH SLA (heavy) I already had for testing. For supporting a 100 mile century ride event, I bought a LiFEPO4 battery (in a bike bottle!) - I was not carrying the weight of an SLA for 100 hilly miles. The amp rode in a small handlebar bag for weather protection (needed - last 15 miles were in rain, last 3 miles were in a downpour!). Check my prior posts for information on the battery and APRS setup. $$$ but worth it for what I needed. That LiFEPO4 battery would run a QRP rig or HT-only forever (at least much longer than I am able to ride a bike in 1 day) and I may use for HF bike mobile with my FT817.

- Why 2M AFSK? The 1st use of APRS was on 30M tracking boats. 300 and 1200 baud AFSK and AX.25 UI packets were easy to implement with the equipment available then. HF is great if skip is a feature vs a problem, there's not a lot of traffic, and you have room for the antenna. 2M FM gear and 1200 baud AFSK TNCs were already ubiquitous and an obvious solution for local coverage. I think if APRS was being re-designed today, a better scheme would be used for HF (FM and AFSK is still pretty reliable for local work) that is more reliable on HF and makes better use of bandwidth. Sound card modems and small cheap PCs didn't exist then, either. Bob WB4APR has posted ideas about a PSK31 satellite transponder - you could fit multiple data streams in a single audio channel passband and have some error correction.

Have you guys checked out the water bottle battery packs, like this one (for example) http ://www.batteryspace.com/waterbottlelifepo4battery128v6800mah8704whforhidhalogenbikelighttr ial-techfemaleplug.aspx

They are available in various voltages and A/h ratings with LiIon, NiMH, and AGM battery options (me, I would go with the AGM option) and with connectors or bare wire options (so you could put your Anderson connectors on them)

Get a two bottle seat post bottle holder, two of these 12.8 volt 6.6 A/h packs and wire them in parallel for 13 A/h operation and you're good to go... Get a 12 Volt wheel hub generator (Dynamo, as an example.. http://www.peterwhitecycles.com/shimano3n70.asp but you'd have to look for the 12 volt versions) on your front wheel and wire it into the battery packs to provide charge while you're riding... What a way to go!

It doesn't look like anyone else directly answered this question, so I will:

Harry, WD9FYF, it is my understanding that the TT4 functions as a KISS TNC
when paired with your computer, but I haven't read anything that suggests
it speaks any protocols other than AX.25. Assuming my understanding is
correct in that regard, then it will work for Keyboard-to-Keyboard AX.25,
it will work for connecting to local AX.25 BBS systems, but I DO NOT
believe it will support any other protocols. On the other hand, I have
never tried... So maybe someone else will correct me.

Yep! I have one of those and bought it with the mating plug-bare wires cables to add power poles connectors. I did find that their Trail Tech connector can easily disconnect if pulled on, so strain relief or some way of keeping it connected may be needed. Otherwise works quite well, fits a bottle cage perfectly, and I don't have to worry about keeping the battery out of the rain. Not particularly cheap, but the power density for the weight is excellent.

Topic: 2693 Message: 2703

Hello Everyone,

THank you for the welcome and sugestions. I have uploaded a few more pictures, where I move the backpack mounting area which allows me space for my panniers and also found a great mount for my IC92AD. THe mount is a Garmin GPS mount that I found at West Marine, cut an opening to put thru a velcro belt that allows me to secure the radio.

Cheers,

Ed

The forum Sunday morning is scheduled. I'm not aware of any program
planned. We also have tried to pull of a ride on the bike trail on the
west side of town the last few years on Saturday afternoon.

It's a commercial version of a Bidwell pusher. You could research those. Instructables.com has some good plans for DIY ones, and also some reviews on their use. I would think it would all depend on what kind of range you're looking for.

If you check the online catalog for Bike Friday you'll see that you could buy a trailer kit and build your own. The hitch on the Bike Friday traileer is better suited for pushing, in my opinion.

Tue Dec 20, 2011 12:48 pm (PST)

If you check the online catalog for Bike Friday you'll see that you could buy a trailer kit and build your own. The hitch on the Bike Friday traileer is better suited for pushing, in my opinion.

2710. Re: question

Yahoo group: BMHA
Date: 2011-12-29 02:33:39 UTC
From: vhuntertdi
Topic: 2704 Message: 2710

Hi Tim,

Mike, NF0N and I will be at the FDIM gathering again this year and we will be staying at the FDIM hotel. We are planning on having another bike ride this year on Saturday afternoon. Weather permitting. If
the weather smiles on us, we will have a great ride, and I hope a short show and tell of the hardware on our rolling ham stations.

Our Forum at the Hamvention will again be on Sunday morning. Mike will have more about what is going on at the forum later as things shape up. We will no doubt have a few bikes at the forum for show and tell again this year, so that others who are getting the itch to ride can maybe get some ideas for their own bikes.

Like last years ride, we will be starting at 1PM on the "Creekside trail" at Eastwood park, and will head south and then southeast to Xenia, we will turn around and head back to where we started. The trail meets up with several other trails and riders can go as long as they want before turning around. Last year I think we did about 25 miles round trip on Saturday. Mike and I checked out the trail on Thursday afternoon, and at the time we did about 40 miles.

Here is a link to the Miami valley trails website info on the creekside trail.

http://www.miamivalleytrails.org/creeks.htm

I look forward to seeing you at FDIM this year. If you are at Hamcation in Orlando in Febr, I'll be there with Joe, K0NEB, and
maybe we will run across each other. Since we are flying down I wont
have a bike with me, as they charge a lot for non-carry on luggage.

More to come as time gets closer. I will post details, my cell phone number and a 2M talk in freq for the trail head.

73 for now...

So, instead of folks using the radios they already have, you want them to buy NEW radios just to use APRS? And the few that do will have fewer folks to contact on the air.

Congratulations, that was quick. I have an FT-817 with a whole bunch of accessories like you did, I may have to sell mine also. I have the Elecraft KX3 ordered and will most likely phase out the 817.

Looking forward to the riding season also, too cold now, but it has to get warmer sometime.

2717. K6BBQ with a video trailer

Yahoo group: BMHA
Date: 2012-01-26 05:41:10 UTC
From: bbqhamtrike
Topic: 2717 Message: 2717

Hi guys

While this isn't related to bicycle mobile, it is related to ham radio.
I want you to take a look at this trailer I have made to promote the February 4th FYBO (Freeze Your Butt Off) contest and to let hams know that I will be making a video of our 2012 FYBO outing.

http://youtu.be/elWjGYdxmsA

If you know of any hams or non-ham friends that would like to see this, please share it with them plus any ham clubs that you think will like it.

They asked "when" is FYBO... not "what" is FYBO.

Not sure... but I think it was said in another group that it will
be Feb 4th... but I'm not 100% sure.

2724. Bicycle Mobile DXCC- Has anyone completed this?

Yahoo group: BMHA
Date: 2012-02-05 14:45:32 UTC
From: Pilotti
Topic: 2724 Message: 2724

For about the past year and a half, I have been operating Bicycle Mobile on 20, 17 and 10 meters, all SSB with 50 watts or less. My bicycle station is amazingly simple, I have worked 89 counties worked from the bike, just 11 more to go for a Bicycle Mobile DXCC. Does anyone know of anyone that has completed DXCC from a bike or who has the highest number of countries worked from a bike?

73 de Mike, KF3CD, West Chester, Pa.

Bike: Trek Antelope mountain bike
Rig: Yaesu FT-100 with control head remotely mounted on handlebars
Antennas: Hamsticks
Power: 12v battery

2725. RE: [BMHA] Bicycle Mobile DXCC- Has anyone completed this?

From: Ron Baran
Topic: 2724 Message: 2725

Hiya Mike,
I've been operating bike mobile since 2000 and last I checked I had 123 countries worked but I never sent out or received very many QSL cards. I have 39 countries confirmed at this point and all of them came when I was a QSLing fool in 2003.
Good luck on your quest. How many of your Qs were while in motion, Mike?
How's WAS going? I went back and found out that I had my last state confirmed in 2003 but I've never bothered to do the paper work to get the sheep skin. Not much of a logger, am I? I DO however log all my Qs during FD. Last year I came in 3rd in 1C class. Not many bike mobiles on FD. I know of two others ... one guy down in TX and K6BBQ. I think I'll bring up that contest stuff again on BMHA early next June.

Sounds interesting. One of my bikes, with 2 meters, APRS and a BOB trailer with an Icom 703+ with buddistick antenna may be on display in the flea market for a local company who specializes in solar energy. Expect to have at least 2 bikes there. One for the ride and the display one. One of them will have the APRS and 2 meter setup that I use as a bike mobile SAG at the Hilly Hundred. I'm sure most of you know that the Hilly Hundred was started by Hartley Alley.

Also, I will probably be arriving in Dayton by noon or earlier on thursday and could go along to check out the trail for the ride if you would like the company for that.

Hi Ron,

Thanks for the reply. Wow! 123 worked fromt he bike is very impressive! I think there should be some kind of award for bicycle mobile mode, it might spur more hams to try this fun mode! For now, my goal is to just get DXCC fromt the bike and as of yesterday afternoon, I have just 9 more to go. Many of my contacts were while in motion (Falklands while pedaling in the dark is the most memorable!) but some were not, I often stick around the house or neighborhood and my thinking is that any way you work them from the bike is good enough for me! All but one contact so far has been SSB but after not being able to work the J38UN "Biddipole DXpedition" to Grenada last week on SSB, I heard them loud and clear on CW yesterday so I hooked up my paddlette to the bike and worked 'em in CW on the 2nd or 3rd call. While I don't really chase states yet, I have 36 so far. What makes it the most fun for me is that nearly everybody I work, is amazed and says that they have never worked a bicycle mobile station before...A45XR in Oman was really blown away that I was bicycle mobile, he couldn't believe I managed to get thru the pileup, neither could I!

2729. RE: [BMHA] Re: Bicycle Mobile DXCC- Has anyone completed this?

Yahoo group: BMHA
Date: 2012-02-06 21:56:25 UTC
From: Ron Baran
Topic: 2724 Message: 2729

Nice going, Mike. I've always wondered why more hams didn't get involved with BM.
I get the same response about being the first BM in a gazillion years of hamming. What's really amazing is the fact that you can, on occasion, bust a pile up with a weenie signal. I think it's all in the timing ... the same sort of thing that comes intuitively to the DX chasers. It is, however, a little anticlimactic when you break the pileup and announce you are a bicycle mobile and the DX station doesn't get it. I try to get it in at least a couple of times but much more than that and you start to sound like a nipple head.
The other thing I find surprising is how much operating time you can get from a couple of SLAs. I pack a pair of 12 AHr cells on the bike in a couple of saddle bags and can operate for two hours, plus or minus, at 100W. (That power level has the added benefit of keeping you warm in the winter.) Most of my rides are in the local suburban area and usually don't go much beyond a couple of hours at a time. During Field Day I have four sets of batteries so I just swap them out when I come in for a Corona logging session.
Oh ... I don't know ... maybe there is some organization that would make the issuance of a certificate of some sort official. Worked a Baker's Dozen BMs or WAS from a BM or DXCC. Might even be a W9 out there willing to administer. You never know. I'm just sayin ...
Hey, have you worked Dave Starkie yet? G4AKC. We had a sked one very chilly Sunday morning a few years ago. I think he holds the distance record for bike to bike qso. Well, I mean, there's a co-holder but I think he was the instigator.
As Cycle 23 started to wind down the QSOs on SSB started to get sparce and conditions were pretty QSB so I switched to CW and, quite frankly, I started to prefer it. I have a palm paddle mounted upside down on a handle bar extension and the manipulation of the key is pretty ergonomic and I can, on occasion, get a pretty good head of steam up. Then I hear ... "how can you send CW and ride a bike at the same time. I can't even walk and chew gum at the same time." I don't know. I can do CW from the bike but I tend to bite my lip when I try to walk and chew gum.
So which came first for you, the bike or the radio?

Subject: [BMHA] Re: Bicycle Mobile DXCC- Has anyone completed this?

Hi Ron,

Thanks for the reply. Wow! 123 worked fromt he bike is very impressive! I think there should be some kind of award for bicycle mobile mode, it might spur more hams to try this fun mode! For now, my goal is to just get DXCC fromt the bike and as of yesterday afternoon, I have just 9 more to go. Many of my contacts were while in motion (Falklands while pedaling in the dark is the most memorable!) but some were not, I often stick around the house or neighborhood and my thinking is that any way you work them from the bike is good enough for me! All but one contact so far has been SSB but after not being able to work the J38UN "Biddipole DXpedition" to Grenada last week on SSB, I heard them loud and clear on CW yesterday so I hooked up my paddlette to the bike and worked 'em in CW on the

2nd or 3rd call. While I don't really chase states yet, I have 36 so far. What makes it the most fun for me is that nearly everybody I work, is amazed and says that they have never worked a bicycle mobile station before...A45XR in Oman was really blown away that I was bicycle mobile, he couldn't believe I managed to get thru the pileup, neither could I!

Donn:

You have a lot of good ideas and retrospectives here:

> At one time, all of us had numbers for our membership
I don't remember any such thing, but I do have (and maintain) the BMHA original membership list (loosly affiliated with this Yahoo group -- see www.BMHA-Hams.org for the details). There is an unchanging membership number (I need to look my own one up -- I'm typing this at work and don't have my superuser access to the database).

If the membership would like, I can add the member number to our online database at
http://www.bmha-hams.org/Content/membership.asp
if people think there is value.

> An award
That's a great idea. Even if ARRL, CQ or whatnot doesn't do one -- all we need is a volunteer Awards Administrator and we can create our own award. I'm happy to add it to our website.

Frankly, I'm >blown out of the water< that we have some members who have done or are close to DXCC while on a bicycle.

My only bicycle-mobile QSL card (I have the card) is with the Pioneer 10 Space Probe well beyond Neptune (it was the special-event station 10 miles from my house, but the card doesn't show that bit of information)
http://www.bmha-hams.org/Newsletter/images/V05N02p08.jpg

> The one-time, life-time $5 was the first and only fee to join. I think that has changed somewhat but remain uncetain
It went to $10/year and has now been >free< for the past several years. Since we don't publish a paper newsletter and I donate the website presence, our expenses are low. We have enough to keep us in business for a few years (there are expenses, but not on the order of publishing and postage).

> get of the bike and do the presentation
Hear! Hear!
Come to Dayton, or volunteer to take a leadership position in our group. We'd love to have you!

> there are apparently other BMHA members that are never asked to do anything
Guilty ... Hartly was a great motivator. Our current leadership (although committed) hasn't been active in recruiting. It is hard when you have a "day job".

> List of possible BMHA awards
Great ideas -- if someone will volunteer to administer, we have the web space and audience to publish these wonderful achievements

In closing, we've been kind of dormant, but we certainly aren't dead. I'd like to give a special thanks to Mike NF0N for keeping our presence at Dayton and doing the hard job of membership administration.

From: bbqhamtrike
Topic: 2724 Message: 2732

Hi guys,

Please allow me to throw my 2.5 cents in although I've never been to Dayton and don't have any plans to fly out from California, I have to watch the money plus pain and stamina issues that keep me from going to the regional hamfest here.

Since it seems there are only a couple who want awards right now, it probably wouldn't cost much to make unique, individual ones on a computer if someone does Adobe Illustrator, Photoshop or some other graphics tool. I think anyone with any of these personal goals, DXCC, WAS, etc. is driven by the sheer fact that they want to do it - I am with my tricycle mobile WAS. I don't operate that regularly but last year I did get my list in order so I know what states I have confirmed with QSL and which ones I need still. If the ARRL had a WAS for mobiles, it wouldn't mean that much to me as I feel bicycle/tricycle mobile is a completely different animal.

Trying to let the general ham audience know that they can earn awards for contacting bike mobiles (similar to hams talking to SOTA - Summits On The Air hams on mountain tops) has one long term issue, it needs a regular stream of activity from the bike mobile hams so that hams chasing the bike mobile ops don't lose interest because of not many bike mobile ops. That's why I wouldn't want to promote it to a general audience.

Hopefully there are hams that would be willing to get off their shack chairs and build a bike mobile station and take ham radio outdoors. I hear more about the pedestrian mobile way and not sure if it is the same people talking or if that group is growing. Sometimes I think whether you do ham walking or pedaling there are only people watching on youtube thinking, "I'll watch that" all the while another potato chip (AKA crisps over in England) is shoved into their mouth.

What to do? (rhetorical question)

Might it be possible to leverage the electronic QSL services (LOTW,
EQSO.cc, qrz.com) to gather and organize the data? I'm just learning
and beginning to see what can be done. Maybe there's a database
search that could pick out contacts with a BMHA in the comments...

Hi Donn,

Thank you for the kind words. I'm glad you like the videos.
I use iMovie for movie editing which is built into the Apple operating system. I don't have any experience using graphic design software. I use a generic, open source competitor to MS Office. If there is a certificate template in there, a certificate would look cheap and run of the mill at best.

If there is a way to give me video footage from your Dayton gathering, I will be glad to make it into a video for the BMHA. That is where my current artistic experience lies.

I think generating a suitable certificate would be the easiest part of the process. Administering the award would be more time consuming and hold more pitfalls.

Neither the ARRL or eQSL offer a DXCC with a mobile, much less bicycle-mobile endorsement. Probably the largest reason for not doing this is the difficulty in documenting this with conventional QSL methods. First of all, the station on the other end only has your word that you are mobile, even if they note it on their QSL, they can't swear to it. Pretty much the same as for QRP QSOs, it's all the operators word.

Being a gentlemanly group, though, this shouldn't prevent offering some award, it would just be purely on the honor system.

I would say that a 3 level approach would be enough to keep things honest.

1. The QSOs themselves should be able to stand up for a standard DXCC, either through the ARRL or eQSL. Apply for the award without mention of the mobile status from one of those sponsoring groups.
2. Then present the award with the list of QSOs and supporting documents - logs, QSLs, etc. - to an impartial party, a radio club official for instance. Many awards do this and accept the statement of the applicant as verified by the club official. This is to verify the mobile aspect of the QSOs.
3. Then that basis would be accepted by the organization sponsoring the Bicycle-Mobile-DXCC Award, say BMHA, and they could be reasonably sure that the award was earned.

Anyone can generate a certificate with a computer and some certificate templates you can get at any office supply. To sponsor one with some integrity and value means doing some due diligence before the award is issued. That gives the certificate some meaning and value.

Any of the above would also apply equally to WAS.

Someone would have to do some considerable amount of record keeping and paperwork to support this, but it could be done. Offering endorsements might be too big of a task, but a basic 100-country Bike Mobile DXCC, should be doable. Even a 50-country award might prove popular. So would WAS.

Certificate chasing is a big incentive to many Hams. This might infuse some fresh activity into BMHA if undertaken.

2740. Antenna question...

Yahoo group: BMHA
Date: 2012-02-07 14:52:57 UTC
From: n1evh@verizon.net
Topic: 2740 Message: 2740

I was looking at a antenna to possibly use on my mountain bike and I was wondering if anyone may have tried it.

Right now... I have a UHF antenna mount on my bike (I know... most people seem to go with an NMO mount). I usually use either a dual-band (2m/70cm) antenna or a tri-band (6m/2m/70cm) antenna on it.

I've played around with a UHF to 3/8-24 mount and a 20m hamstick. Now I know without a counterpoise... it won't be the most efficient antennas... but according to both an MFJ antenna analyzer and my Diamond SWR meter... I've tuned it to an SWR that my FT-817 is happy with (and I've worked various US states and European countries with it).

I'm looking at the Opek HVU-100 antenna. According to the Opek website... this antenna uses a UHF antenna mount and it can be configured/adjusted for up to 5 bands at once. So with one antenna, I could have both VHF/UHF and HF I could set it up so I could have 20m/10m/6m/2m/70cm... I could set it up for 40m/20m/6m/2m/70cm, and so on.

Now... I know people will talk about the lack of counterpoise on a bike and so on... but like I've said... I was surprised to get an SWR with a 20m hamstick and have it work the way it has.

Right now... I have to decide if I want to put either a VHF/UHF antenna or an HF antenna on my bike... and with a antenna like this... I could have both (if it would work).

Al,

I could not have summarized my thoughts on this subject any better than what you have done!!

The path you suggest is very logical and could lead to a very special award goal that would be savored and recognized for its uniqueness among bicycle mobile advocates. I think a few special "rules" would need to be a part of it to insure that all contacts were made while using only an antenna actually connected to the bicycle frame.

I am very impressed and encouraged by those who are above or approaching the DXCC while bicycle mobile milestone. I think I have something like 33 countries confirmed and they were all with 2 watts.

I look forward to the BMHA forum this year at Dayton and hope my talk as well as comments and experiences from others will raise the awareness of HF bicycle mobile operation.

I suggest looking at how QRPARCI handles their awards for WAS, DXCC, etc.
http://www.qrparci.org/content/blogsection/4/116/

In particular, read rule #2 (click on the "More" link on the above page):
"Confirmations, in the form of QSL cards or other electronic logbook data, such as EQSL or LOTW, are not required for all Awards offered by QRPARCI."

"With your application please include a listing of claimed stations complete with log data and a GCR Form signed by 2 amateurs attesting that they have examined your logs and verify your qualifications for the Award. Your list should conform to the individual format of each Award as listed."

This is very similar to what Al suggests; QRPARCI has a track record implementing it.

w9xs WAS, DX-L, or maybe even DX-LXXV (How the hell did the Romans build those viaducts with that numbering system?)
Hey, how about FD? How'd we score that? Have no idea - probably multiplier for 5W (x5) cw mult (x2), as already in the FD scoring; mult for contacts in motion (x2) as opposed to stationary (1x), a little something to acknowledge miles covered (x points per mile) and, of course, don't forget a 100 point bonus for butt blisters (max of 3)
I think the honor system and a submitted log is pretty reasonable. If we have to wait for QSLs to show up via buro we might all be in walkers (would you need a counterpoise if you put a ham stick on a walker?)
That's my story and I'm sticking to it.

Did I hear correctly that there is a bicycle outing from Seattle to Portland that one can do in one day or two? Are there hams in this group? I was told about 10,000 people get in on it.

My figures are probably wrong but am curious anyway.

Any groups want to send me something for the QRP Quarterly Clubhouse column? If so, please also send pictures with captions.

Hope to see everybody at Dayton.

Two years ago my wife rode and I was SAG for our team (Bad Ass Coffee Cycling/Salt Lake City). Most of our team did the two day option while a couple of the hard core riders did it in one day. Registration for STP usually fills up within a day or two once it opens, and if you are not a member of Cascade then you have to wait until the general registration starts about a month after the club registration.

2757. RE: [BMHA] Antenna question...

Yahoo group: BMHA
Date: 2012-02-10 22:30:34 UTC
From: S. Earl Jarosh
Topic: 2740 Message: 2757

Simply if it works, it works. The term counterpoise is often misused. A true counterpoise has a capacity reaction with the true ground (Dirt on real ground) to improve the effectiveness of the antenna. This is simply not possible on a bike. Please reference one of the best discussions of this http://www.antennex.com/shack/Dec06/cps.html. So now we come down to the fact that many of the bikes that most of us are willing to afford are some form of metal which becomes your pseudo ground plane and admittedly a very small and directed one. Dragging a wire behind you can improve the efficiency as you would now have the antenna centered between 2 ground plane radials but I already get enough questions about the antenna on my bike let alone helpful people trying to inform me about a problem with my bike because there is a wire dragging on the ground behind me. I too seem to do well enough with a FT817 and a hamstick mounted on the rack. If it loads up it will work. Use to load up a bed spring with my TR4.

2760. Rem & Jason: Re: Bicycle Mobile DXCC/WAS

Yahoo group: BMHA
Date: 2012-02-11 02:40:51 UTC
From: bbqhamtrike
Topic: 2759 Message: 2760

I was surprised to read this. I know Donn had included my message (in a string of several posts discussing this design) to the group when I had declined on designing a certificate. Over last year I have learned how to make videos but that doesn't mean I know graphic design. I do not have graphic software nor experience. Adobe Photoshop, Illustrator and Quark Express are not simple things to learn but take many months just to use at entry level from what I understand having attended a few MacWorlds in the past.

So I am not sure if you asking what product I have is wondering what photos I may have that could be used for one of these DXCC or WAS awards. I am amazed that there are people who have worked DXCC. I would have thought WAS is a much more obtainable goal but that is coming from a ham on the West Coast where DX contacts are made more often.

If you want me to look through my photos at photos of my recumbent tricycle, I will be glad to. I know not many have recumbent trikes, I am not sure if anyone else reading this does.

So let me know if you want me to look for trike photos.

Rem

Dan & the rest of the group:

> As far as I know, there are precious few members of BMHA left from the days when Hartley was our fearless leader

Probably true -- but this is also a sign of continued interest. Hartley was such a powerful and persuasive force (I still recall his gentle-but-forceful arm-twisting that had me helping with the newsletter for many years).

I've been following the DXCC/Bicycle award discussion with interest -- I am far from qualifying and am simply amazed that people have come close -- not to mention exceeded -- DXCC on a bicycle.

I agree with both featuring the BMHA logo on the award and naming it after Hartley. Both are excellent ideas.

With Dayton coming up as a place to possibly introduce and/or publicize the award, I'm thinking that we should have a page on the BMHA website for it.

(Since I manage the webserver, I know that this is possible to do . . .) As the team considers the design and rules of the award itself, let's also think about how we might want to highlight it on both the website itself as well as a page devoted to the award.

Great work so far -- I'm impressed.

Undoubtedly!

> One thing I'd like to see is the WAS included into the certificates. Easy enough to do, I suppose. And, it expands the table for us, includes more opportunities for others, etc.

Given the low-power and limited-antenna nature of Bicycle Mobile,

we should definitely offer WAS as well as DXCC.

Are there other regional awards (what is done for 160, for example?).

Anything relating to all-states-in-a-given-call-area?

Other ideas?

I got tired quickly of being stopped multiple times by the people with good intentions telling me of the dragging wire.

I finally scraped off some paint on the inside of my bottom dropout (where the rear wheel fits into the frame) where a bolt goes to hold my rear rack and then connected a ring terminal to it and the nut was tightened back in place. The ring terminal was crimped onto a piece of tinned ground braid. The other end of the ground braid (also crimped into a ring terminal) is screwed onto the side of my FT-857D using one of the mobile mount holes. The paint here was also scraped off just a bit. Ever since then I have enough of a ground where I don't need the dragging wire!

2770. A New BMHA GAME!!!

Yahoo group: BMHA
Date: 2012-02-16 06:15:52 UTC
From: bbqhamtrike
Topic: 2770 Message: 2770

What's happened, where did everyone go?
It's quiet, too quiet. I guess everyone got certificated out with all the awards and certificate talk.

So here is something to get everyone talking again!
I am not a website developer but I have a fun idea, a VERY FUN idea -

I can see an online webpage for us with a BMHA game where we click a button and a virtual game wheel spins. On the wheel are six different items, three good and three bad -

Bike/M x Bike/M QSO (warm fuzzies, another spin!)
WAS (Onto the next goal and another spin!)
100 DXCC (get another spin!)
Getting "doored" (end of turn)
Fall and Break Radio (game over man) (end of turn)
Go Home, Dead Battery (start over) (end of turn)

There can be an online score where we can compete against one another.

That OR there can be a page we can print out that has a bike path with individual squares, each square is one move. Spin one die (not two dice) and one of the six choices is represented by one of the numbers. You could play at home with your friends, you could play over Skype or you could do something like the long distance chess games and email each other what your last move is and who goes next.

SO WHAT DO YOU ALL THINK???

If it's great say YAY and if it is lame, take a stab at creating a different BMHA game.

Sounds doable. I'm game.

Keith,

Your display sounds interesting and we would be more than happy to have you display in our forum room on Sunday if you can. We have a large room and love to have bicycles with their equipment on display. Our forum should start about 9:15 but the room is open earlier for display. Arnie, KA0NCR will have more details on the ride, which is on Saturday and we would welcome you for the ride also.

Hope to see you at Dayton this year.

One of my bikes, with 2 meters, APRS and a BOB trailer with an Icom 703+ with buddistick antenna may be on display in the flea market for a local company who specializes in solar energy. Expect to have at least 2 bikes there. One for the ride and the display one. One of them will have the APRS and 2 meter setup that I use as a bike mobile SAG at the Hilly Hundred. I'm sure most of you know that the Hilly Hundred was started by Hartley Alley.

Answer: Securely

More seiously .. we need to know what antenna you are mounting and where on
the bike you plan to put it.

I would suggest a clamp on rack attached to your seat post with the
antenna mounted to the back of it. You will not stick it in your eye
etc, it is not by your head and if you do not use the rubber shims it
will be grounded to your frame.
See the picture of my track bike in the Spring 2009 Newsletter or the
article in the or the article in the Spring 2008 issue describing both
the Track and road bike installation.

2776. Re: [BMHA] Antana mounting info?.

Yahoo group: BMHA
Date: 2012-02-16 23:48:41 UTC
From: n1evh@verizon.net
Topic: 2772 Message: 2776

On my Trek 3700 mountain bike... I put a rack on the back of the bike.

I then bought two 36"x1"x1/8" pieces of aluminum at Home Depot. I cut each one in half... giving me 4 pieces that are 18" long. I then held one of the pieces to the rack... marked it and drilled holes to mount the aluminum to the rack. Then I clamped all 4 pieces together and drilled all 4 pieces the same (I did this as a single 1/8" thick piece was to flexible... four 1/8" thick pieces stiffened it up.

For the antenna... I mounted a right-angle piece of aluminum and put a 2" SO-239 feedthru barrel. This allows me to use antennas with a UHF mount (although lots of people prefer using an NMO mount).

I can take some pictures to e-mail you direct if you would like to see what I did.

What I did years ago is wire tied a 3/8" copper tube to the rear frame facing back away from the saddle.
Then took a bike flag and tapped a 5/8" wave twinlead antenna then put heat shrink over the entire thing except for a short length of coax at bottom and left enough of the bottom open to slide it in the copper tube like a rifle sheath so I could take it on and off real easy. Put the radio and batteries in a zipper bag on luggage bar on the back of bike. Used it on many a MS bike ride to both stay in touch and provide support for assistance when required.

Oh, this oughta be rich. Ask any 3 hams "What's the Best Antenna?" and you're lucky if you only get 35 conflicting answers. Biking hams are even worser.
My unwashed vote is for the fiberglass J pole, fashioned from the ubiquitous bicycle flag pole, which then serves double duty. See
http://www.qsl.net/w5aox/images/JPole_W5AOX_Bike.jpg for construction details. If, however, you're truly mountain biking, through the trees, a more rugged solution (with reduced effective range) would be a HALF-wave ground plane clamped at your convenience on the front or back of the bike (look for a Larsen NMO150BHW for a very rugged one)
-Then you can clamp it on whatever rack, rail, or metal you have available in the rear. You can look at mine at:
http://www.qsl.net/w5aox/W5AOX%20APRS%20BikeMobile.html

Mounting in the rear keeps the whip from popping you in the face, while rear mounting complicates throwing your leg that direction when mounting the bike. Me, I mount my J poles on the rear and have taught myself how to lean the bike over sideways so I can mount it without kicking the antenna or support tube.

2780. RE: Antenna mounting

Yahoo group: BMHA
Date: 2012-02-17 14:39:32 UTC
From: Jim Bassett
Topic: 2780 Message: 2780

I have a rack on the back where I used a very simple mirror mount with 3/8 24 thread. Around town I use a couple different antenna. I have a 1/4 wave dual band that stays nicely out of the way. When commuting I put up an 80 inch colinear Hustler, 2 meter, as self defense from the city bus. Before using the 80 inch one the bus would come within inches of my head with their mirrors. Now when they come up behind me I start swinging the antenna and they change lanes. I have not commuted since Nevada passed a new traffic law requiring all vehicles passing bicycles to be at least 3 feet from them.

Currently not running HF however my HF Hustler antenna will fit the same mount.

Only 35? :) I second W5AOX's comments and will add my own. My overgeneralized rules of thumb: bigger is better, higher is better, rugged is a necessity. And bikes provide poor ground planes, so avoid antennas that need one to work well (5/8-wave). My best results have been with flagpole-mounted antennas (j-pole, coaxial-dipole, slimjim), end-fed half-wave (the Larsen).

Flagpole antennas can mount to almost any bike at the rear q-r skewer (but get a heavy-duty one and check tightness regularly). You'll need zip ties or velcro straps or tape to keep the feedline away from your wheels and drivetrain. They sway alot when pedaling hard (climbing), which may annoy riding partners, strike overhanging low tree branches, and may make you more visible to drivers. They are relatively cheap (even if bought ready-made) and are good home-brew projects.

The Larsen HW with an NMO mount has been my best overall; there are knock-off versions from Lakeview and a few other firms, I think. Costs a bit more, but you get a very rugged and reasonably light system. I bolted an aluminum plate extending off the back of the rear rack on one bike; the NMO mount screws into a large hole in the plate. I could have drilled the rack itself (but would loose ability to mount a trunk bag). On a full suspension MTB, you could use a seatpost rack, or fashion a stinger from aluminum sheet. On my road bike, I bolted a plate with an NMO mount to a water bottle cage, then mounted the cage to a behind-the-seat bottle clamp.

I also tried a simple 1/4-wave whip. I did tests on a repeater and ran APRS for several weeks on my commute and looked at how many packets were collected by the local network gateways to compare the 1/4-wave, 1/2-wave, and flagpole antennas. Flagpole worked best, 1/2-wave was about the same, 1/4-wave worked but was noticably poorer. 5/8-wave was about same, sometimes worse than the 1/4-wave and not worth the size & weight.

My photo album http://groups.yahoo.com/group/BMHA/photos/album/1949487468/pic/list shows older setups (I need to update with the Larsen & NMO rack mounts). The HF station has a mirror mount clamped to the rack for 3/8x24 HF antennas (or VHF, of course). For mechanical strength, I prefer a solid rear rack and a 3/8x24 or NMO mount.

I've never weighed any of my stuff, bikes included. If I can hold it up long enough to get rolling I'm happy.
When I first got the recumbent I was amazed at how much faster I could go. I was actually able to overtake and pass a couple of old ladies and younger guys with flat tires. THEN I transferred the luggage racks, backpacks, panniers, antennas, radios, GPS, etc,..... and the 'bent was no longer noticeably faster than the old road bike. But still much more comfortable..... Huff, Puff..... I like my junk.
I now have a trailer upon which to mount more antennas, solar panels, and such. Ca n hardly wait to see how fast I can pull that.
Never done a century yet, nor an overnighter..... yet.
I HAVE been a regular year round commuter - over 3500 miles per year average, but only 15 to 30 per day thus far.
Since I was recently downsized and now jobless and at the magic age of 65, centuries and overnighters and cross country trips... still dreamin'.

Here comes conflicting answer 36 and 37. First, I like your fiberglass setup but I have build many a Jpole with 300 ohm twin lead and RG58 or RG8x http://www.qsl.net/wb3gck/jpole.htm . If you do it this way you can get bright colored shrink wrap and shrink wrap it to the fiberglass pole which would be a little easier. I take one to pull up into trees. I personally go on long trips and use a alloy rack mount which mounts to the seat post and lower bike frame to carry my equipment. I then drill a whole on the back of the rack mount for an NMO and put a 1/2, 5/8, or multiband on it. With a good ground to the bike from the rack I have no problem with the SWR, the 5/8 using the bike as a ground seems to work better and when I rode around Lake Superior I had no problem hitting the few Canadian repeaters and I could always get the Canadian weather service on the NOAA weather frequencies. Here is a picture of the bike loaded down. You can barely may out the 5/8 on the back http://jaroshs.home.comcast.net/~jaroshs/images/bikeTrip/Photo_070908_003.jpg

Note: if you have a carbon fiber bike, 1/2 wave anything is your only choice.

You realize, of course, carbon fiber is conductive? Especially in an RF sense?
When I worked in satellite antenna design at Los Alamos, I ran tests on carbon fiber rods as antenna elements. It is of course not as conductive as most metal frames used on bikes, but it would make a usable grounding system.
Realizing, of course, that if I paid thousands of dollars for a carbon fiber bike, I would be as loathe to grind or drill into the frame as anyone else......

2786. RE: [BMHA] Re: Antana mounting info?.

Yahoo group: BMHA
Date: 2012-02-17 20:33:29 UTC
From: S. Earl Jarosh
Topic: 2772 Message: 2786

LOL, did not want to go down that path but, yes I did. I just did not want to start suggesting people grind or drill to complete that ground. I thought that might create a bigger stir but now we have conflicting answer 38.

You realize, of course, carbon fiber is conductive? Especially in an RF sense?
When I worked in satellite antenna design at Los Alamos, I ran tests on carbon fiber rods as antenna elements. It is of course not as conductive as most metal frames used on bikes, but it would make a usable grounding system.
Realizing, of course, that if I paid thousands of dollars for a carbon fiber bike, I would be as loathe to grind or drill into the frame as anyone else......

From: Rem .
Topic: 2770 Message: 2789

Wasn't there word that either the BMHA logo or some logo Hartley made would be used? Also I believe someone mentioned a simple bicycle wheel.

A possible slogan on the card -

Bike Mobile,
Carbon Neutral
and Radio Active!

or maybe not? I landed on my head too many times and that last time when I cracked my helmet brought my weirdness to a permanent plane.

Don't worry, things aren't completely dead--I'm working on two possible certificate designs, just taking some time (plus out of town half the time these last two weeks)

Something will be popping out of the mill soon...

2791. Bike Mobile WAS/DXCC

Yahoo group: BMHA
Date: 2012-02-20 17:16:37 UTC
From: Al Gritzmacher
Topic: 2791 Message: 2791

Okay, to keep the ball rolling, I've created two very basic simple certificates as a starting point for something to use with these awards. I've uploaded them in PDF form to the Yahoo Group files area in a folder called CERTIFICATE PROPOSALS. They are just that, only proposals of what my vision of them would start out at. Please feel free to use them as a jumping off point for more elaborate designs.

I know someone commented about the topic going quiet. If the group wants to sponsor such awards, it's a long-haul thing. No need to rush into it. A pause in activity may be a good thing to get some perspective.

With Dayton coming up, I'd think that would be a good time for a group to get together and further pursue this idea.

BTW, I know that several people from the early days who knew Hartley are still around. I wrote a few articles in the early newsletters and remember several conversations with Hartley on the phone discussing them. He'd never hesitate to pick up the phone and suggest an article if he thought you were an 'expert' on some aspect of bike mobile Ham radio. That's the kind of enthusiasm and persuasion the Hartley used to get this group off the ground.

Al,

Thank you for taking the time to create these conversation starters. I think they are a great step. I think those of you that meet in Dayton might be able to collaborate and come up with additional details. Since the BMHA logo has been with the group so long, I am guessing from the beginning, that might want to be kept as it is unique rather than a bicycle wheel which is generic to all of bicycling. Perhaps for the WAS either a map of the US in four corners or ... and for the DXCC globes of the Earth on it.

Thanks for your time on these,'

2796. Bicycle Mobile DXCC Done!

Yahoo group: BMHA
Date: 2012-03-04 02:19:25 UTC
From: Pilotti
Topic: 2796 Message: 2796

I finally worked #100 today from my bike! Having had an unusually mild winter here in Southeastern PA. has allowed me to get out on the bike quite often in the past few weeks and months and with the ARRL SSB contest going on today, there was lots of good DX on and I was able to work my last 5 for an unofficial Bicycle Mobile DXCC...now if I can only chase down all the QSL cards!

Nice going. I'll just bet there will be an official BMHA award just around the corner with #1 on it. Quite an accomplishment from a bike. Tell us about your setup. Perhaps a few pictures.

My bicycle mobile setup is surprisingly simple. I started out with a single band, 20 meter MFJ Travel Radio, 20 watts with a hamstick and rechargable battery pack, the ones they sell to jump start your car. That battery was a bit large and heavy so I switched to a smaller battery, the kind used in the alarm system where I work, for battery back up in the security and fire systems. I think it's a 7 or 8 Ah battery. If you know someone at a security co, most would be happy to give away these used batteries because they replace them at regular intervals so the ones they remove are usually as good as new. I worked a bunch of DX with the little 20 watt rig but with power that low, it was a struggle to work anyone that had less than a 57 signal so I took my Yaesu FT-100 out of the car and bought a mount for the handlebars so the control head is remotely mounted in front of me. I have an MFJ speaker mounted on the angled bar in front of me/between my legs and a mount that I bought on e-Bay, that securley holds my iPhone on the other side of the handlebars so that I can watch the DX cluster. The hamsticks get mounted on the back to a simple aluminum mount. I have no special ground and they work great! Often I can hear stations on a hamstick better than I hear them on my 135 foot long OCF dipole at home! For me, the best part about operating bicycle mobile is that almost everyone says that they never worked a Bicycle Mobile before and they are amazed! I do have a few photos on QRZ.com but they are from last summer and I have changed things a bit since then, I'll try to take some new photos soon and post them.

I forgot to mention, the power on the FT-100 is variable so I usually operate at 35 or 40 watts, never more than 50 and I can generally work everyone that I can hear.

I was starting to work on it in my corner but have been caught up in other things this last week and haven't touched the design (it's the beginning of the school term here in Korea)...sorry :(I didn't realize it was so urgent, but if someone can do it faster, why not. It's still on the back burner here...I hope the design will be interesting. Maybe I can post it this week--

From: Rem .
Topic: 2796 Message: 2805

Donn, Jason and guys,

My two cents and three wheels suggests an outline or drawing of the Earth on the award and maybe even a bicycle on top of the Earth like the ham has talked with places near and far.

For the USA Worked All States one how about one faded continental image in the center of the award and all of the writing on top of that image, that or...

Over here on the West Coast I doubt I will ever get trike mobile DXCC, I started HF in October 2002 and I am hoping to get the last four or five needed to finally get to 100. That is just from and and portable. However, trike mobile WAS I have less than 10 states to go! That goal seems very doable for me.

Just some ideas.

2807. Re: [BMHA] Re: Bicycle Mobile DXCC Done!

Yahoo group: BMHA
Date: 2012-03-05 13:43:48 UTC
From: Al Gritzmacher
Topic: 2796 Message: 2807

I uploadedtwo designs
<http://f1.grp.yahoofs.com/v1/0LhUT-9xtfW6KKQQEm51_XSW-uNyzU34FBjukrgYMv3xpnalBGTOOIhznKcSoYhStC6Ivzb0tlR4e6cUY-h47jHFav49zYGCPsbq/Certificate%20Proposals/BMHA-DXA.pdf>
to the Yahoo Group files page a while ago. Now that they are created as projects, it's easy to modify elements in them, if desired. They were created in Microsoft Publisher. If someone wants the .pub files to carry on from there, I can provide them as well. They would be the file used to generate the award with the recipient's name on, anyway. Different graphics, different wording, all is possible, it just has to be decided on by the group.

Speaking of which, there seems to be a big hurry to rush this to completion, but being a loose-knit group, there isn't any real consensus yet on the whole idea. Before someone goes out and says "Here's the BMHA Bike Mobile DXCC (or WAS) Award" how does the group make it official and put their support behind it? (or not) I'd hate to see a few awards get issued, then the awards get dropped for lack of a sponsoring group's support.

As I've said before, it's easy to make a piece of paper that says it's an award. Making an award that is worth more than the paper it is printed on is harder. The real meaning and value of such an award is the status it holds because it is given by the organization that maintains it and regulates it. I wouldn't want to see Hartley's name on it, unless it had the full support of the BMHA as a whole.

Probably the closest thing we have to a meeting is Dayton and that's probably the only opportunity we'll have to hash this out. I'd say that anyone who has ideas for these two awards should make them known before Dayton and hopefully someone will take the bull by the horns and run with it then. By ideas, I mean both certificate designs and award criteria. Both need to be resolved before such an award can be announced. Someone also has to step forward to administer the awards. Without that person, the whole discussion is moot as well.

2809. Re: [BMHA] Re: Bicycle Mobile DXCC Done!

Yahoo group: BMHA
Date: 2012-03-06 13:32:41 UTC
From: n1evh@verizon.net
Topic: 2796 Message: 2809

I've NEVER had any luck with clicking on a link from ANY Yahoo Group for seeing the file in the link that was uploaded to the Files section (I always get that "Not Found" message)..

You're best bet is to go to Yahoo (www.yahoo.com)... sign into Yahoo with your username and password... click on "Groups" on the left hand side... then select the BMHA group... then click on "Files" when the BMHA group page comes up.

In the Files section... I found a folder called "Certificate Proposals" with the two .PDF files that were listed in the other links.

2811. Re: Bicycle Mobile DXCC Done!

Yahoo group: BMHA
Date: 2012-03-08 19:25:06 UTC
From: wc4xned
Topic: 2796 Message: 2811

Al,

I really like both the DXCC and WAS designs and hope we enthusiastically discuss and endorse them at Dayton.

2812. Two new web pages -- HamVention 2012 and the BMHA operating awards

Yahoo group: BMHA
Date: 2012-03-09 05:21:39 UTC
From: Skip
Topic: 2812 Message: 2812

I have added two quick pages to our webserver at
http://www.BMHA-Hams.org

Dayton HamVention 2012 details:
http://www.bmha-hams.org/Timely/Dayton2012.htm

BMHA Operating Awards (reposed from the Yahoo Group files area)
http://www.bmha-hams.org/Awards/default.htm

- Skip AA6WK

2814. Re: [BMHA] Two new web pages -- HamVention 2012 and the BMHA operating awards

Yahoo group: BMHA
Date: 2012-03-09 14:14:15 UTC
From: n1evh@verizon.net
Topic: 2812 Message: 2814

I like the preliminary designs... but would the Worked All States
award look better with a background outline of the USA showing
all of the states (outlines of Alaska and Hawaii could be put down
in the Gulf of Mexico).

Just a thought.

Mike - N1EVH

operating awards

Ah, finnaaalllly.....I figured out how to get a view of the new awards and
hasten to add my belated
thanks to everyone. This is a terrific job we can all be proud of and
make the effort to obtain.
Thanks to all, Donn, KA0SOH

2815. New Bike Rules

Yahoo group: BMHA
Date: 2012-03-09 17:04:56 UTC
From: Jim Bassett
Topic: 2815 Message: 2815

FYI, in Nevada they just passed a new law and it is now in effect. When passing a bicycle on the road you must give the bike 3 feet of clearance. Although the law is known to those of us on bikes it appears that not all motor vehicle drivers have not heard ot it. So just because we have it as law remember to ride defensively.

We have the same law in Georgia---but it does not seem to change motorist behaviour significantly. AGREE---Always ride defensively!!

Arizona has had that law on the books for quite a while. Most drivers are surprised to hear about it. The driver's manual and test for a license don't mention any of the traffic laws relating to bicycles. The laws don't do any good if nobody knows about them.

2820. new antenna on my mountain bike...

Yahoo group: BMHA
Date: 2012-03-17 21:21:21 UTC
From: n1evh@verizon.net
Topic: 2820 Message: 2820

Well I ordered and got my Opek HVU-100 antenna in the mail. I borrowed a friend's MFJ-269 antenna analyzer to assist in tuning the HF coils for the antenna.

On my mountain bike... the 6m, 2m, and 70cm SWR is "ok"... but I got a better SWR with my Diamond CR627B tri-band antenna.

Took awlile playing around with the HF coils. Opek gives you two "short" stingers/whips (about 3 inches long) to use with the 10m, 15m, and 20m coils and then like a 15.75 inch stinger/whip for the 40m coil.

20m was a pain... I couldn't get a good SWR at all. According to the MFJ-269... I needed a longer stinger/whip. I measured the diameter of the stinger/whip... and it was about the size of 16 guage wire. I had some 16 gauge stranded wire... but when I tinned it with solder (to make it stiffer)... it wouldn't fit in the coil. So I stripped and tinned some 18 gauge stranded wire. I made it about 5 inches long. As I checked the SWR with the MFJ-269 and trimmed the piece of wire... it appears that I need a stinger/whip of about 4 inches to get a good SWR in the 20m band (now I need to find something even stiffer than the tinned 18 gauge stranded wire to replace this with).

Time to hook up my Yaesu FT-817 to the antenna.

Met up with a friend (also a ham) for lunch today. After lunch... I was showing him the setup and tuned around on 20m a bit. There was some kind of contest going on. Well... there were a few state QSO Party's and a contest where after listening for awhile... the exchange (on SSB) was RS and QSO number. I heard SN2B in Poland coming in pretty good. My friend told me to try and work him. So after he called "CQ Contest"... I threw out my callsign and he got me on the first try.

So... I'm on my way to DXCC with this antenna on my mountain bike :-)

Hello Mike,

Most Opek mobile antennas use 0.1" stainless steel rod for their whips / stingers. You can get replacements up to 54". That should get you lots of material. They also have 102", but it may be tapered. I would be most interested to learn if you have success. MFJ has a similar multi-band mobile. Blaine's Farm and Fleet carries 0.1" electric fence wire. I used some while determining the correct whip length for a 40m mobile that was cut way too short.

Well... I measured the diameter of the stingers/whips that came out of the HF coils on this antenna with a micrometer (I know... I need to buy a digital caliper) and they measured about .05 inches. The outside diameter of 16 gauge wire is .0509 inches. I stripped some stranded 16 gauge wire and it fit into the coil... but it didn't fit when I tinned it with solder.

I was looking around online and I found some 17-7 PH Stainless Steel rods (I think a lot of mobile antenna manufacturers use this stuff) that was .044 inches diameter and 60 inches long. So I ordered some of this. I'll make some stingers/whips out of this for the HF coils on this antenna.

The antenna is designed to have 2 HF coils on it. The antenna is OK if I put the 10m and 15m coils on it.... but for some reason when I had the 20m coil on it and put either the 10m or 15m coil on it... my 20m SWR went sky high. So I'll probably make 2 stingers/whips for the 20m coil... one when using the 20m coil by itself and one for when using the 20m coil with another HF coil.

I seen how wide the SWR bandwidth was on 10m... and then seen how the bandwidth got narrower on 15m and even narrower on 20m. I haven't tried playing around with the 40m coil yet... I can imagine how narrow this antenna will be on there.

Topic: 2823 Message: 2823

In regards to you mixing 20 meter coil with either the 10 or 15 meter and the SWR going high. I found the same problem, on my car, with my Hustler when putting up multiple coils on the 60 inch mast. High SWR appeared when I put up coils with multiples of 7 MHZ together, i.e. 40, 20, 15, 10 meters. When I put up a 40 meter, a 17 meter and a 12 meter the problem did not occur. I do most of my mobile work on 17 and 12 meters and hope to get a small radio so I can do those on my bicycle.

Thanks for letting us know how you made out. It will give me a head start when I step up to HF Bike Mobile from UHF/VHF Bike Mobile

Thanks for setting me straight on the whip diameters! I should have stated: the Opeks I have used. I am glad to read you have a micrometer! Cuts down on your searching and guessing!

Were you planning on operating while in motion, or parked and extending some radials / counterpoise? Bicycles don't offer much counterpoise.

You've learned a great truth --- the lower the frequency, the narrower the usable bandwidth!

Well... "most" of my operating will probably be when I'm stopped someplace, but yesterday (Sunday)... I did work a few stations that were taking part in the North Dakota QSO Party while in motion (both of them were in North Dakota). So now I'm on my way to WAS on a bike too :-)

Since my little FT-817 is only 5w... I'm thinking about sending my radio off to
W4RT Electronics and have them install their DSP filter, dual-filter board (the
FT-817 only has 1 spot for a SSB or CW filter... their board will allow both the
SSB and CW filter to be installed)r, and speech compressor into the stock mic. This little radio with compromise antenna needs all the help it can get to be heard on SSB.

2826. VA QSO Party Bike Mobile report

Yahoo group: BMHA
Date: 2012-03-19 12:48:59 UTC
From: BrassRat77
Topic: 2826 Message: 2826

Had a great time - 122 QSOs, 10 states, 2 countries (US & Canada). Activated 5 counties/cities. Weather was fantastic Saturday and OK-to-great Sunday (foggy and cool/overcast until mid-afternnon). An HFPacker amplifier made a big difference in my QSO rate, although calling CQ was still a 100% waste of time and watt-hours.

The station is an evolution from my 2010 setup. Antenna is a 22" Hustler base rod, MP-1 coil, MFJ telescoping whip (extended when stationary). The big whip and longer base rod make tuning easier (broader SWR dips) vs. the stock short MP1 base rod and whip. I have to shorten the amount of rod extended above 17M.

I did not use a counterpoise or temporary radials this year. I noticed that my bike frame was "hot" - I could feel stray RF when my finger touched bare metal (stem bolts at steerer tube) while transmitting. So there's probably room for further improvements. Did not notice changes in SWR, however, from standing near/away from the bike.

Power was provided by a 2.5 AH LiFePO4 pack (Batteryspace "A123" type) for the FT817 and a Batteryspace "water-bottle" LiFePO4 pack for the amplifier. Both had plenty of capacity for 6-7 hrs of operating each day of the contest.

I added photos from the weekend to my album:
http://groups.yahoo.com/group/BMHA/photos/album/1949487468/pic/list

Thanks for the compliments guys.

For my videos I use iMovie from Apple.
This movie editing/making software also allows photos and music to be added. It also can separate the audio from the video part of a clip so if you only want to use the video or audio, the other part can be deleted and another bit of audio can be added to that image or vice versa.

I am glad to know that so many of you are enjoying these videos.

I have to wonder if the iMovie software on the iPad2 is the same iMovie 11 program that are on the Macs with hard drives. If I am correct, I understand that the iPads use Flash memory and there isn't a hard drive. Editing video takes up a lot of RAM as well as hard drive space so maybe the iPad iMovie program can be run if you have an external hard drive? Regardless, good luck on that.

I hope you can go out and do the ham bike/trike thing. It is a lot of fun. This group is a good resource but I also suggest you join the HFpack Yahoo group if you aren't a member already. There are lots of portable -pedestrian, bike, kayak mobile operators there and besides picking their brains, there are helpful files to download in their Files section of the group.

Please keep us updated on your progress to go bike mobile.

I hope you can make it happen and do the trade. I've seen some decent prices for MacBooks that are only a few years old. When I bought this two years ago it had 4GB total of RAM. Once I upgraded up to OS X Lion, my iMovie video editing started sputtering because OS Lion takes up so much RAM that iMovie didn't have enough. I bought two 4GB cards which gave me a total of 8GB RAM. Problems solved. I can edit movies again without having those iMovie problems.

Please keep us updated on your progress and I will look forward to your videos when you start making them.

Rem

If I am correct, I understand that the iPads use Flash memory and there isn't a hard drive. Editing video takes up a lot of RAM as well as hard drive space so maybe the iPad iMovie program can be run if you have an external hard drive? Regardless, good luck on that.

The BMHA website has a separate (and older) membership than the Yahoo! group. Although the groups are related!

For the BMHA website database, send me the info on
http://bmha-hams.org/Info/Info-MembershipApplication.htm
and we will get you into the online database.

Instructions are on the webpage listed above.

Solid state rigs have made bicycle communitions possible.

When I was in the Air Force one of my jobs was to maintain an airborne doppler radar navigation system on the B-52. The system weighed about 900 pounds. For a 2010 Air Force reunion that occurred in the West Indies, a partipating C-54 arrived on the island using a system that fit in the copilot's shirt pocket.

In those days the recent bicycle awards were beyond our wildest dreams.

2844. K6BBQ tricycle mobile Saturday

Yahoo group: BMHA
Date: 2012-04-21 05:22:18 UTC
From: bbqhamtrike
Topic: 2844 Message: 2844

Hi

I will be tricycle mobile for the South Dakota and Michigan QSO parties Saturday. I plan to be moving around 15 and 20 meters but I will be checking off and on the HFpack frequency of 14.342.50 (plus or minus if occupied). If you see this before 15:00 GMT, send an email if you want a sked. My email is on QRZ.

I don't see any takers for a special sked, so I will be listening out for any of you at the top of each hour from 1700 till 21 or 2200 gtmt on or around 14.342.50.

have a fun radio day if you can get on air.

2847. BMHA Hamvention Forum time for new award discussion

Yahoo group: BMHA
Date: 2012-05-04 19:30:32 UTC
From: Mike
Topic: 2847 Message: 2847

The Hamvention forum is quite busy this year but I would like to leave open some time for discussion on the new proposed WAS and DXCC BMHA awards. If anyone want's to be the moderator for this discussion, let me know before or during the forum so we can allocate time to the discussion or proposal.

Just a reminder, the BMHA forum is May 20 at 9:30 am in Room 5.

2851. Dayton Hamvention BMHA bike ride.. its a week away!

Yahoo group: BMHA
Date: 2012-05-13 00:30:16 UTC
From: vhuntertdi
Topic: 2851 Message: 2851

Hi Group,

I posted something about this a few months back, but I want to put out another post now that we are only about a week away from the event as a little reminder.

To save re-typing a lot of stuff (something I don't do well), here is the link to the BMHA website about this years Dayton Hamvention BMHA activities.

http://www.bmha-hams.org/Timely/Dayton2012.htm

Even though the date on the web page is showing 2011, and the wrong day number, the rest of the info on the page is correct. We are scheduled to hit the trail on Saturday the 19th, at 2PM.. Mike, NF0N will be manning the trail head this year while we are out on the trail, since he had work done on his shoulder and the doctor says its a No-No for him to ride yet. We will be on 146.55MHz simplex from about 1:30PM onward if someone needs a talk-in. Call NF0N or KA0NCR.

Also, a good way to find the place and see the route on the map would be to start up Google Maps, zoom in to the Dayton area and on the left side of the screen under traffic, click the drop down box and select "Bicycle". Look near "Riverside" and find "Eastwood park". The trail going south is the creakside trail. It turns south east and heads to Xenia.

I hope to see a bunch this year. Last year we had great weather and the trail was great.

Arnie caught a placeholder from last year's ride announcement on the website.

It has now been updated correctly. Enjoy the ride!

From: vhuntertdi
Topic: 2854 Message: 2854

Thanks Skip!

You are right on top of things, I didn't even see your reply while typing my "PS" message.

Mike NF0N and I are going to leave Tuesday afternoon for Dayton, stopping to stay overnight in Cedar Rapids, IA with Gary, NQ0V.

Gary is one of the organizers for our RAGBRAI bike group "team MegaCycles", and will be one of the forum speakers at the BMHA forum on Sunday.

Thursday afternoon several of us will be out on the creakside trail checking it out so we have no surprise waiting for us on Saturday.

2856. Knee's

Yahoo group: BMHA
Date: 2012-05-13 19:51:17 UTC
From: Johnny Shepherd
Topic: 2856 Message: 2856

Hello all been sometime since I posted! My health was very poor last year so most of my biking and ham radio activity was ver limited but I am determined to change these circumstances! Any one riding that has bad knee/s and can give me some riding tips?

I have a EZ-1 Super cruiser Bent, a Trek mountain bike and a Lotus Elite 600 Triathlon bike and am thinking that since both of my knees are very painful especially my left knee which will be replaced in about 3months I should not ride the trek MB so the choice is between the EZ-1 and my Lotus 600. Which do you think would be easier on my knees considering that each has a different stroke configuration? Any specific cadence/Spinning techniques? 73 Johnny KD5LWU Cortez, Colorado

Johnny,

Usually, lowering your seat, softer suspension, lower gears, higher spin rates are what you want. Knees handle lite rotational loads much better than heavy pushing/support loads.

Johnny,

I think you should be very careful with those knees. Maybe you should ask your doctor the question you just posted.

Hey Johnny, I have used your systems both via echolink and RF when within range of your system.
As a rabid bent rider, with a bit of a trick knee, and with a wife with very bad knees who is now riding a recumbent catrike, I highly recommend you stick with your bent. Much easier on all the human hardware and joints. I'm taking my bent to Hamvention and plan to again go along for the ride...

Hi Jim nice to hear from you! I am half thinking (that is my normal state these days lol) I might stagger the bikes so as to work different sets of muscles for strengthening and all muscles surrounding the knees but using most the bike least painful. Does that sound like a plan?

2863. Re: Dayton Hamvention BMHA bike ride.. its a week away!

Yahoo group: BMHA
Date: 2012-05-14 14:32:07 UTC
From: va3bit
Topic: 2851 Message: 2863

I also expect to arrive in the area about noon on Thursday. This is my first Hamvention and I only recently discovered and joined BMHA. I look forward to the ride on Saturday and forum on Sunday. I expect I'll be cycling the Dayton trails on Thursday afternoon/evening. No HF on my bike (yet) but will monitor 146.55 and can be found at va3bit-6 on aprs.

I just uploaded 20 images from BMHA Hamvention 2012 too. Look for the W5AOX Hamvention 2012 folder.
Again many thaks to Keith KA9RSL for the ride to the BMHA starting point and back to the motel Saturday.
Some images are from my 18-mile ride on Monday from our Miamisburg motel to the air museum at Wright-Patterson via the Miami River and Mad River Trails. VERY nice ride; rode right up to the Air Museum parking lot.
Great to see all the human powered riggings...

I mounted an MFJ Clear Tone Speaker on my bike, where the water bottle mount was, between my legs. I was able to use the same bolt that held the water bottle mount, to mount the speaker bracket and I can swivel the speaker to point it up towards me. These speakers are cheap (12 or 15 bucks) and sound much better that any speaker built in to a radio. They come with a mounting bracket so there's many possibilities for attaching it to your bike or trike.

73 de Mike, KF3CD

Now at 110 countries worked from my bike, all with 50 watts or less, a Yaesu FT-100 and hamsticks.

Mike,

Thank you very much. I just looked at the MFJ 281 Clear Tone speaker and MFJ 382 speaker amplifier. The 281 uses 8 volts and the 382 uses 9 volts or 110 volts AC. I wanted to run the speaker off of a 12 volt battery but I might have to settle on using rechargeable 9 volt batteries. I really like the idea of being able to use the bolt at the water bottle mount. That is a brilliant location!

It is not that hard to get 9v off your 12v. Just build a simple 9v regulator using the 7809 (there is also a 7808 and 7805). These have been around since I was a kid. Go to http://www.circuitstoday.com/9-v-regulator-using-7809 for a classic design.

Also the LM386 is available in a 1 audio Watt design. Low power drain and works as a great amp on any speaker. I used a couple of them to build a battery powered guitar amp back in the 70's. You can pull all kinds of design schematics from the web these days.

2873. HT Antenna for Bicycle Mobile?

Yahoo group: BMHA
Date: 2012-05-31 18:57:27 UTC
From: Brian
Topic: 2873 Message: 2873

Hello, long time bicyclist, new ham.

I'm looking to see if I can get a simple bicycle mobile setup for area charity rides. I want to try to do this with my Wouxun dual band HT in my back pocket and a Pryme headset with a PTT button clipped on to my jersey. I'm thinking the HT should be good enough here in So Cal, because we are near sea level but will have line of sight to nearby repeaters at over 5500' elevation.

The sticking point may be the antenna, which won't be pointing vertical when in my normal riding position. I need to replace the rubber duck antenna anyway, any HT antenna suggestions?

Brian,

We did a communications event here not to long ago with the march of dimes and I saw another ham, with the same type of radio as yours or a VX-8 - can't remember which radio it was actually, but, he had a mobile mag mount antenna, think it was a Comet or something around the likes and took that mag mount to his blackburn rack and took two zip ties mounted the antenna there across the mag mount - worked pretty well - wish, I had a picture of that set up, but, didn't think of it at the time.

A thought on the Wouxon KG-UVD1P (and possibly other wouxons): The antenna connector is a male SMA instead of the standard female connector, therefore requiring a female to female SMA adaptor before connecting a standard antenna.

I haven't seen an adapter that goes from female SMA to BNC... And so I run two adapters. The reason I run BNC is because it's quick to switch out between my vehicle, base, and whatever other antennas.

However, the construction of the radio isn't as reinforced as many hams are used to... Therefore I try to minimize stress on the antenna connector on the radio by using the factory ducky when walking around events.

For what it's worth, the performance from the factory antenna is roughly equivalent to my Jetstream JT776SMA on the same radio, despite the conventional wisdom from other brands that suggests you never run a factory antenna... YMMV.

I do have that model Wouxun, but I forgot to mention that I do indeed have one of these SMA to BNC adapters also:

You can also build a J-pole out of twin-lead and attach that to one of those bicycle safety flags on fiberglass poles. That gets it up high.

I wish I had pictures to show you, but...

A lot depends on whether you have a metal (steel, aluminum etc) frame bike or carbon fiber...

My wife rides a carbon fiber bike and I've got a Comet 14" whip velcro strapped to the seat tube (vertical tube from crank to bottom of the seat with micro-coax wound around the diagonal tube up to the bag attached to her handlebars where the Icom IC-T90A sits in a side pocket in the bag and the speaker mic is clipped to the cable sheath... it has been suggested that we set up a tigertail where the coax connects to the radio, but really we haven't seen a need to as she's been able to hit repeaters on every ride the bike's been set up like this on (and that's a lot of rides over the past 4 years).

I would suggest that you try just using the factory setup first to see if you have any problems. I rode with a HT in the center pocket of my jersey for years and didn't have any problems hitting the repeaters. At the time I was living in Missouri and riding in Missouri and Kansas.

I use a vehicle mirror mount (the type truckers use for CB radio) on my rear aluminum rack that has the 3/4 24 thread. I took the dual band MFJ 18 inch antenna out of its mag mount and screwed it into the mount. This mount will also work on the handlebars however, it was a safety hazard to my eyes.

There is also a clamp on type mount that can be used on the seat post however you will have to use a piece of flat metal to extend the antenna mounting position so it is clear of your seat. The clamp works on the vertical post where the mirror mount works on the horizontal post.

Good Luck

2882. Hamstick to Outbacker convertion?

Yahoo group: BMHA
Date: 2012-06-01 17:22:29 UTC
From: vhuntertdi
Topic: 2882 Message: 2882

Hi Group,

At the BMHA forum this year there was a hand out by one of the presenters (Ned?) about converting a 80 meter hamstick to a poor mans outbacker.

I didn't get up to the table in time to get one of these handouts. Mike NF0N tells me that there is a copy of this in the files section, but I have
not been able to find it. I searched by Ned's e-mail and by outbacker and hamstick to see if there was any reference to a file here on yahoo. All I found were a couple of people chatting about it back in 2001 or so..

Anyhow, If someone could point me to it on the web, or if anyone has this info stored away, if they could forward it to me at my E-mail address of KA0NCR "at" Yahoo "dot" com it could save me re-inventing the wheel.

From checking out the antenna at the ride, and the results, I think I would like to try this antenna out. It looks like it would stand up to a lot of trail use and abuse and seemed to work well on the air. The price is right too!

From: AOX
Topic: 2873 Message: 2883

As always, I recommend the bicycle flag pole J pole
(http://www.qsl.net/w5aox/images/JPole_W5AOX_Bike.jpg) for both visibility and Radio Performance.
That said, the black Teflon-clad springie thingie 19" whips sold at Hamvention (works well for both 2 meters and 440) worked very well for me before I graduated to J poles. Even mounted just on top of the HT they offer much improved performance over any rubber duck, which will work, occasionally, with disappointing comments from others such as "I can't make out what you're saying..."

Hi Arnie,

I just uploaded the BMHA newsletter that has the article about my antenna. It is in .pdf format in the "files" section of the forum. Hope it helps. I am happy to answer any questions.

From: Rich Kuster
Topic: 2873 Message: 2885

Life is simple on a road or MTn bike w/ bike rack. A little piece of aluminum flat stock off the back with a fold over diamond dual band 1/2 wave & you are good to go. Get the thin cable kit from RF products with connector that goes direct to your ht. they'll make custom length with Sma or whatever u need at reasonable cost. Avoid the monkey business of multiple connector/adapter from pl259 as that puts a heck of a load on the ht body. Connect a speaker mic & toss ht in the handle bar front pack. I'll look for some photos to post later tonight.

Hello All,

I am going out 20M SSB bicycle mobile by the sea on Monday morning between 05:30 GMT and 08:00 GMT .... Propagation into the USA has been terrific recently so I hope some of you guys may be on from home ... I realize its a little late at night / early in the morning to be out bicycle mobile ... unless you are west coast.

Dave,

Good luck on your 20 meter bicycle mobile adventure. That will be at 10:30pm California/West coast time. I will be asleep but if I was awake I would put up the Buddipole outside and listen for you. I hope you make some QSOs with North America.

2888. SMA-UHF adapter cables

Yahoo group: BMHA
Date: 2012-06-04 03:29:23 UTC
From: w0rmt
Topic: 2888 Message: 2888

Folks-

who is your preferred source for UHF female -> SMA male adapter cables? I need something relatively short for my bicycle mobile setup with the HT. I'm using a Diamond K412CNMO trunk lip mount (re-purposed from my truck) on the bicycle's rear rack. This assembly terminates in a UHF connector, but rather than using an RF adapter I'd like to use a short adapter cable to relieve strain on the HT body. So I'm looking for something rather short (between 1-2').

Thanks in advance.

Hi

I have eight states to go (7 if I count the LOTW QSL with Hawaii as theat ham hasn't responded to two of my QSL cards) until I work all 50 states while tricycle mobile.

Can any of you point me to a website where I can post that I need certain states and if ops from those states might respond to me?
My QSO times are daytime only and I can only operate from 10-20 meters so the 40 meter award nets won't be of help to me.

Rem,

The K3UK web sked page is one good resource to make sked's. It's actually several types of sked's to make, LOTW, QRP, etc. Here is the address:
http://www.obriensweb.com/sked/index.php?board=skcc

I used this when I was going for the Triple Play Award.

Topic: 2889 Message: 2894

Thank you everyone,

I already have the K3UK FISTS skeds bookmarked and thought of this but didn't think about asking for help on these. It seems their Ragchew section would be the most appropriate.

I am looking for 50 QSL cards. I am not currently an ARRL member and don't think they offer a WAS mobile. I'd like the cards as a souvenir of having contacted all 50.

The remaining states I need are -
AR, DE, HI, MS, NE, NH, NJ, and SC.

From: alanstevenson753
Topic: 2904 Message: 2904

I have found that you can get two for the price of one with speaker wire at 50m long, normally the cost for anything around 40 strands can be £25-28 you can get if you know where to look twice the amount for £10-12 and in most cases free postage, look for the thickness first. Alan.

You like lamp cord and say its better how come!, wire is only as good as its strands, so how many has your lamp cord, you do see audio wire with 322 strands how that count them I do not no this is weak wire!!!!! how about such wire with 40 strands which I have used even as a end feed, in fact almost any copper wire that is multi stranded with a count of over 2 is better than a wire with only one strand. So what antenna wire do you use pref as a end feed long wire, at the moment I am looking at copper fencing wire, a 100m reel for only £30.00 thats 100 metres long, it has a breaking point at 375 pounds LBS. Alan G6LSW/A.

Hi Scoot. What you have not said is how many strands has this lamp wire you use. Can I also presum that you use side light or bed side wire and both sides as a antenna run!
What I was in fact saying was that for the cost you can get 50m of non rot cooper speaker wire and too runs for the same cost.
Guys out there just ask the seller HOW MANY STRANDS HAS IT 40-300 is good plus what type of covering has it, what I do use is the white with a black stripe I have lost count past 40 just how many strands it has must be a minimum of 160 LOL. Alan

Alan,

My experience with speaker wire is limited. I've used it for fabribating light-weight, tuned antennas for portable work, trips into the mountains. They work well if zip ties are used to keep the strain off the connections. Lamp cord has a heavier insulation that bears up better, in my opinion. On site antenna repair is often difficult. I've been known to use a camp stove as a soldering iron. Not convenient and death on insulation. That's my take on it.

Fact is, I have a 20m dipole fabricated from speaker wire that circles my bedroom. :-)

So what antenna wire do you use pref as a end feed long wire, at the moment I am looking at copper fencing wire, a 100m reel for only £30.00 thats 100 metres long, it has a breaking point at 375 pounds LBS. Hi Scott. Gas soldering, my first soldering was done this way blooming great heavy bump of copper bit and flux dipping plus those fhumes its and wonder I am still here.
I have a 10m roach pole that I slip black rubber rings over you can buy a container of these sizes are from little finger to wrist size, the containers has compartments for the sizes each section has about 20 and 10 sizes see ebay very handy for a vertical.
As to wire up the side of the pole the price for real antenna wire the clear pvc covered type was $18 for 10m were as speaker wire was only $8 and looked the same amount of wire strands.
I now rest my info and case, good luck with that camping stove soldering. Alan.

2914. Getting ready to go WCM with a TRX-80

Yahoo group: BMHA
Date: 2012-08-11 08:54:36 UTC
From: alanstevenson753
Topic: 2914 Message: 2914

Hi Group. REceived yesterday from a US friend as a gift a TRX-80 coil and very well made it is too, never taken the step to go /pm but the xyl has a electric wheelchair which see runs people over with due to going blind in one eye so I am going to use it at 70 yrs old I deserve it.
I set up the TRX-80 as follows do not make my mistage... I did not have a 8' 5" SS whip so I looked around ar I said that old CB antenna might do the trick, the "Stinger" or top whip is 54" the bottom SS rod is 27" and the centra coil is 9 but note unknown amount of turns on it, the set up on 14 mhz WITHOUT a earth wire inside the room tuned up very well so at least I had done something right as a first time user, but even with a earth wire it would not tune 7 MHz -10 MHz 18 but tuned well on 29.995!!! so the set up was to long!!! taken the coil apart the wire on it was 8' so the total came to 14.75 feet and not 8' 5" as the seller was using, where have I gone wrong!
Should I just run a bit of wire from the coil holders eg SS whip goes into the top hole and the SS rod in the bottom and bridge the gap. Alan g6lsw.

Date: 2012-08-12 20:25:59 UTC
From: g4akc_mobile
Topic: 2917 Message: 2917

Hello All

Been out on my HF bicycle mobile recently as the weather has been quite good here in the north west part of England.

So, operating 20M ssb "bicycle mobile" from the beach area near Blackpool England with up to 200 Watts pep from around 05:30GMT - 08:30 GMT.

The following were all worked on SSB with really good signals both ways:

VK3VBC/Mobile
PE1OAD/MM (Southern Australia)
KF5FBR/M0bile
CO6LE
K7EMF
W9BDN
K6JAT
NZ6RQ
K7BB
NA7RH
K1ZPZ
W7VJ
VE6MV
ZL1GQ
N3IYR
ZL4DH
ZL4DH/Mobile
VE6LRR
VK2DEL
VK3HJ
VE7VF
ZL3ADW/Mobile
VK3MRG
VK3GL
KH6YY
VK4MJ
VK7BC
VK6HCF/Portable QRP
VK2DD
VK5ZKT
VK7ROY
VK6ACF
OE6MBG/P/I3
VK6ACF/Mobile
VK3MJB

VK5ADK
9Z4BM
E51JD
KJ4RWQ
ZD7FT
AA6K
VK2MTC
KA5KZF
VK6AKT
VK7ZE
VK3NF
VK3PAH
VK3LY

20M is in good shape, so a very enjoyable trip out.

Plan to be out on again on Tuesday morning (14th Aug) from about 05:30 GMT and as there has been good propagation to the west coast USA from the UK recently it would be good to make a contact bicycle to bicycle mobile, hope to hear from you guys!

2926. Interesting Handlebar bracket for accessories

Yahoo group: BMHA
Date: 2012-09-03 16:16:03 UTC
From: BrassRat77
Topic: 2926 Message: 2926

I recently came across an interesting bracket sold by velo-orange for mounting accessories on handlebars. It bolts on in place of two of the bolts retaining the handlebar clamp for threadless stems. I installed one this weekend - installation is very easy - you need a 6mm open wrench and a 4mm allen wrench. The mount is 31.8mm diameter and made of a hard slightly rubberized plastic.

It will work very well for lights, computers, clearing handlebar space for the important stuff (radios!). I think it is strong enough to handle lighter radio equipment (HTs, removable faceplate/control heads). If someone wants to loan me a KX3, I'd be happy to test that! :) I'm not sure if it is rugged enough to support an FT817 but I plan to give it a quick try.

I've uploaded photos of the bracket installed on my commuter to my album. The bracket is adjustable side-to side; the photos show it slid over to the right. Search for KS1G in the photo area and look for the 3 "Dajiaa handlebar bracket" photos: http://groups.yahoo.com/group/BMHA/photos/album/1949487468/pic/972290839/view?picmode=&mode=tn&order=mtime&start=1&count=20&dir=desc
The photos show a side, front (with cover removed to show the side-to-side adjustment) and top views. The Minoura mount I've used for my FT817 is beneath the Dajiaa bracket, I'll decide later which bracket I'll use for what items.

Link to the product page at velo-orange: http://store.velo-orange.com/index.php/accessories/leather-goods-handlebar-grips/accessory-mount-for-threadless-stems.html

Hope this information is useful for folks looking to rearrange the "cockpit" of the bikes.

2927. APRS - Using GPS from iPhone or Garmin Edge 500

Yahoo group: BMHA
Date: 2012-09-07 22:55:18 UTC
From: Brian
Topic: 2927 Message: 2927

Although I've read through some of the old threads for APRS on a bicycle mobile setup, I have a specific question on the GPS.

The simplest out of the box APRS solution seems to be the Micro-Trak AIO. But it seems redundant since I already carry a Wouxun HT and a GPS from either my iPhone or my Garmin Edge 500. I know I can use a TinyTrak with the Wouxun HT. But is there a way to use the GPS from the iPhone or the Garmin?

The GPS must be capable of outputting NMEA-83 format serial data. It is THEORETICALLY possible to pass the sentences through a the iPhone using a Bluetooth to serial adapter, but I have never known it to be done... and I speculate Apple would likely deny any app that tried. A similar technique is used in APRSDroid on Android, proving its possible, but very few users utilize that approach.

A quick google search suggests the Garmin is not NMEA capable. Even if it were, most consumer grade navigation units won't properly display APRS data.

Your best bet is probably the GPS receiver offered with the TT4... It's relatively inexpensive, and seems to get the job done. If you were looking to replace your Garmin, consider the AVMap G6aprs. It is engineered purposely for use with a TT4 and APRS.

So how are the TinyTrak combos with the Bionics GPS2? I've been running the Wouxun HT in my back pocket, would the TinyTrak/GPS be small enough to fit in my back pocket? How about getting the cable that will let me power the TinyTrak/GPS from the mic jack on the HT - a good idea, or will it drain down the HT battery? (And after typing all this, I realize plugging the TinyTrak/GPS into the HT will preclude me from plugging an external mic/earpiece...)

I don't know the answer to all those questions, as I have never actually held the TT or it's GPS... However, on the subject of a headset, remember that the Wouxon is not true dual receive, so even if you COULD have both, voice and APRS are mutually exclusive...

There are applications available for the iPhone that will allow it to be your total GPS solution.. some of them will even allow the iPhone to access iGates through it's G3 connection so your position can be tracked on aprs.fi as well as radio based tracking solutions.

Another option for the iPhone is PocketPacket which allows your iPhone to send APRS packets over your TNC equipped radio..

http://itunes.apple.com/us/app/pocketpacket/id336500866?mt=8

Check the video on using Pocket Packet

>>> Brian<bpdlists@...> 9/7/2012 4:55 PM >>>

Although I've read through some of the old threads for APRS on a bicycle mobile setup, I have a specific question on the GPS.

The simplest out of the box APRS solution seems to be the Micro-Trak AIO. But it seems redundant since I already carry a Wouxun HT and a GPS from either my iPhone or my Garmin Edge 500. I know I can use a TinyTrak with the Wouxun HT. But is there a way to use the GPS from the iPhone or the Garmin?

Even better, thanks. I set up an account on openaprs.net and downloaded the OpenAPRS iPhone app. It should be sufficient for my occasional APRS usage. Though does anyone know what the "CMRS" option does in the iPhone app?

Brian,

I'm not a serious APRS user, but I have an OPENAPRS account I use with my 3G iPhone. In July W7LK and I used it to communicate between Texas and Oregon. Sometimes I put the phone in my shirt pocket to track my bike progress. However, the battery doesn't hold up well. A couple hours and it's done. I've also taken cell calls while OPENAPRS is running.

Jeff,

No, I have only the iPhone. I discovered the APRS apps after the fact.

2937. Can you help me raise funds for the MS Society?

Yahoo group: BMHA
Date: 2012-09-10 02:01:32 UTC
From: Steve Nielson
Topic: 2937 Message: 2937

We need to be careful how many (if any) of this sort of message we allow in the group. It is a good cause, but not directly related to the topics of ham radio while bicycling. I'll let this one through for now, but will be selective about future approvals. If you (the readership) have strong opinions, they can be sent to BMHA@... and we'll review policy.
National MS Society I have just learned that a good friend and fellow cyclist who is planning to ride with me has also donated to the MS society in my name! WOW, I feel special, someone donated to this charity in order to get to ride with me! Of course I am a bit passionate for this cause with a sister-in-law and niece (mother & daughter) living with MS. I have paid and donated: * Paid – Even as a volunteer, we pay the cost of our participation. (Yes, there are some sponsors and group purchasing, but we pay our way – your $ do not pay for our rides!) * Donated – Yes, I donate to the cause too! Can you help? Any amount will be strongly appreciated! I am riding about 150 miles while helping other riders. * 1 Cent a mile is $1.50 – That would help * ...$2.50...? * ...$5.00...? * ...$7.50...? * ...$10.00...? * ...$12.50...? * 1 Dime (10 cents) a mile is $15.00 – That would help! * ...$25.00...? * ...$50.00...? * ...$75.00...? * ...$125.00...? * 1 Dollar a mile is $150.00 – That would help! You get the idea! I don't want to set an upper limit if you are so inclined! Please visit National MS Society today!

2940. Antenna Mount on Seat Post Water Bottle Bracket

Yahoo group: BMHA
Date: 2012-10-04 02:26:15 UTC
From: Brian
Topic: 2940 Message: 2940

Last weekend I was a bicycle mobile for the first time, a report is here:
http://www.kj6vzv.com/2012/10/02/my-first-time-bicycle-mobile-experience\/
On the next ride, the repeaters are going to be harder to hit, so I want to move from the HT/antenna in the back pocket setup, over to a bicycle mounted antenna.
I dug out this water bottle seat mount from my parts bin:
http://twitter.com/BikingBrian/status/253309964469297152/photo/1
Then I'll make an aluminum shelf for the antenna, similar as to what is described here: http://www.gobahams.org/how_to_wire_a_bike.pdf
I'll pick up a Diamond C101 UHF mount (what size hole will I have to drill for it?) and then move my Comet SBB-5 1/2 wave antenna from the minivan over to the bike.
With an antenna mounted on the bike, I don't like being tethered to the bike by having an HT in the back pocket. So I'll get a Topeak or similar cell phone mount for the handlebars and a speaker mic.
Any fatal flaws with the setup, or other refinements?
Brian DeSousaKJ6VZVOrange, CA

I don't like using a speaker mic. It means taking one hand off your handlebars. I prefer using a headset, however that entails more "connection" to the rig.

I deal with that by carrying the rig on my belt (if my bike outfit does not have a belt I use one only to carry my HT). Some sort of a quick disconnect in the antenna line is a good idea ... something as simple as not twisting shut a BNC connector will work.

So do you have a PTT button on the bicycle?

Here's a photo of my first attempt at the antenna mount. I put the bracket in a vise and bent the front holes so the antenna would be vertical. But then the aluminum on the bracket started showing some cracks (see red arrows). Will it still be strong enough to hold? Or maybe I should make a second attempt with a larger aluminum plate also going to the back holes on the bracket. Other thoughts?

Here's a link to my favorite ebay vendor for motorcycle PTT and helmet setups for the Kenwood TH-D7 and others:
http://www.ebay.com/itm/220584814791?ssPageName=STRK:MEWNX:IT&_trksid=p3984.m1497.l2649
For $25 including shipping it's hard to beat. I have 2 of them on different bikes and the oldest one has lasted over 4 years of almost daily riding.

> Will it still be strong enough to hold?

Vibration will probably break it in short order. Here's what happened to an unmodified Diamond antenna mount attached to the seat frame of a recumbent:

http://softsolder.com/2009/07/10/commercial-mobile-antenna-mounts-on-a-recumbent-failures-thereof/
<%20http://softsolder.com/2009/07/10/commercial-mobile-antenna-mounts-on-a-recumbent-failures-thereof/>

My homebrew mounts still show no signs of strain:

http://softsolder.com/2009/07/11/recumbent-bicycle-amateur-radio-antenna-mount/
<http://softsolder.com/2009/07/11/recumbent-bicycle-amateur-radio-antenna-mount/>

http://softsolder.com/2010/05/18/re-rebuilding-a-recumbent-antenna-mount/
<http://softsolder.com/2010/05/18/re-rebuilding-a-recumbent-antenna-mount/>

As nearly as I can tell, nothing exceeds like excess!

Thanks - so it looks like I will move onto attempt number two. New water bottle mount (this one is still available), flipped upside down, steel plate mounted to all four holes, then a bend in the steel plate in order to make the antenna point vertical.

2947. Re: Antenna Mount on Seat Post Water Bottle Bracket

Yahoo group: BMHA
Date: 2012-10-05 14:25:23 UTC
From: Jim Bassett
Topic: 2940 Message: 2947

One of my younger hams tells me I run old school when it comes to mounting antenna and radio on my bike.

My antenna mount is a automobile Mirror mount, 3/4 inch wide and about 3 inches long, with 3/8 24 thread for the antenna. This allows for me to use a variety of antenna, 1/4 wave 2 meter, dual band-2 meter/440, 2 meter 80 inch Hustler co-linear, or HF. This is mounted on a the far end of my rear rack on the right side. The coax runs under the rack, wraps around the center bar all the way to a handle bar bag (old style). Since most of my mobile ops are on one freq I tuck the radio into a safe padded part of the bag. I run a headset under my helmet. I modified the lining of the helmet so it is comfortable with the lightweight headset. Boom mic has a foam windscreen to hold down the noise. The PTT is tie wrapped to the handlebars so I can comfortably reach it with my right thumb. The PTT switch is a 3 position. Neutral for off, left is monetary, right is locked on until I touch again to move it off. This set up works well for public safety events and commuting. I have crash into a sidewalk when force off the road by a car and none of the equipment was even scratched. Only the riders pride was injured until he caught up with the local police bicycle patrol and gave them the license plate number of the car. The driver was really surprised when two bicycle police officers pulled him over to allow him to received a ticket. Justice. We have more support in this area now that Nevada has passed the 3 foot rule where cars passing bicyclist must move over to allow 3 feet between car an bike when passing.

Enjoy your bike mobile operations.

> I dug out this water bottle seat mount from my parts bin:

Look at the last few issues of the BMHA newsletter for my system which
uses a clamp on rear rack and a set of Aero bars to support the radio
and antenna.
Advantages are ease of seeing the radio, hand fredom and keeping antenna
away from body which also lets you swing leg over bike a bit easyier.

Once aluminum gets a crack in it, it quickly spreads. I'd replace it immediately with something a lot beefier.

So do you have a PTT button on the bicycle?

Here's a photo of my first attempt at the antenna mount. I put the bracket in a vise and bent the front holes so the antenna would be vertical. But then the aluminum on the bracket started showing some cracks (see red arrows). Will it still be strong enough to hold? Or maybe I should make a second attempt with a larger aluminum plate also going to the back holes on the bracket. Other thoughts?

A small, clean, and round hole at the end of the crack may turn it back on itself.

Brian:

I have a few pictures (look under KS1G in the Photos area) showing my old set-up; I used a Profile Designs holder and modified a water bottle cage to hold the antenna. The pictures show my older setup which held a stand-alone APRS tracker built around a Byonics unit. For the current version. I bolted a NMO-style flat fender mount to the bottom of the cage, then attached a NMO-base and Larsen HW-1. A dual-band might work too, but I didn't want the poor ground-plane hassels on a carbon frame road bike.

The Profile Design mount cracked after a couple of seasons of use (I think commuting with my 24oz coffee thermos did it in). The replacement failed (cracked at the seat post clamp) after 2 months! I've replaced it with an XLabs Turbo Wing that bolts to the saddle rails instead of the seat post. I haven't tested it yet with the antenna mount, but based on carrying 2 water bottles over 3 century rides, it appears to be better-built than the Profile Designs system.

I think the same mechanical approach (maybe add a brace piece to the seat post but not carrying as much load) could be adapted for a home-brew antenna mount. I'm hoping to give this a try and will post pictures if/when I do.

I just bought one this past weekend for my recumbent trike. It comes with two gasket strips to adjust for handlebar thickness and protect the metal. The entire device is plastic except for all the hardware (screws) the clamp has a thumbscrew and it has a ball joint with about 20-30 degrees adjustment. The rectangular attachement plate for the HT has two provision placed 180 degrees apart, one will act as a slot-mic clip (will not handle anything thicker than about 1/8 inch) or a slot opening that simulates a belt so that you can slide an HT belt clip or one of those seperate belt clip slot-mic type dealies into. My Yaesu VX6 (with belt clip) fits perfectly into the slot and there is a raised portion inside to simulate other side of a "belt" so it is held firmly.

2957. Kx3

Yahoo group: BMHA
Date: 2012-10-12 16:53:45 UTC
From: Arnie Grubbs
Topic: 2957 Message: 2957

Hi Barry,

I have a kx3, and I have been mulling over how it will be mounted on my Sun lwb 'bent. Was hoping that Elecraft would have their mobile mount out soon, and i would use that as a starter for mounting it on the "handle bars".

I guess with the wx turning colder now I can just sit back and think about different mounting schemes and wait for the mobile bracket from elecraft...   Sigh..

I figure right now that I will try to mount it with something that will reduce the shocks to it from road vibrations.. not sure what would be a good material for doing that though.

I am thinking of using two of these clamps from dx engeneering...

http://www.dxengineering.com/parts/dxe-rsb-i03400

to clamp an aluminum strap across the vertical sections of the handles to support what ever i finally come up with to actually hold the radio..

The antenna for the bike will probably be a poor mans outbacker that I am building up from an 80 meter iron horse mobile whip. The design of this antenna is in the bmha archives somewhere..i forget the actual issue it was in..

Ride safe and. 73

From: Pilotti
Topic: 2958 Message: 2958

This was not my first bicycle mobile contact with St. Helena but I managed to video some of this QSO on Saturday. Next time I'll have to try to get someone to video for me because it's a little difficult to ride, talk and hold my iphone up to record! Also need to remember to hold the phone horizontally when recording, this time I held it vertically thus the video is compressed to the center of the screen. I now have 128 countries worked from my bike in the past 2 years or so, all with 50 watts or less and I'm waiting on less than 20 cards to be able to confirm my Bicycle Mobile DXCC.

While this isn't a tricycle mobile video, it is an entertaining one, even funny. Last weekend I went to the Pacificon ham radio convention in the San Francisco Bay Area. I did a presentation on my ham radio tricycle mobile station. I also took some time out to interview some hams and ask them a few questions that they've never been asked before. Some of you will recognize some familiar ham faces.

Hello everyone.

I have started a state based BMHA related yahoo group today called:
Bicycle Mobile Hams - Michigan
at:
http://groups.yahoo.com/group/bmh-m/

I am wanting to get something started for next year's season of bicycle riding in the State of Michigan.

I did bicycle mobile/VHF this past Sunday (October 21, 2012) and did 32 miles based on the GPS in downtwon Detroit. So I did some searching on the Internet Monday morning and found that Michigan has plenty of trails and paths to offer up that could be enjoyed by both Hams and their families that want to bring gear with them.

My goal is to have at least a once a month gathering somewhere in the state and get out and enjoy both hobbies along with scenery. Could even plan a picnic mid-ride or a cookout afterwards even though my preference is for the cookout :)

This group is not ment to replace or usurp the BMHA in any way at all. Hopefully I can get those that join this state group to join the BMHA so that everyone can benefit.

2972. Dealing with spam messages

Yahoo group: BMHA
Date: 2012-11-12 14:17:25 UTC
From: Skip
Topic: 2972 Message: 2972

Our group has been remarkably clean of spam messages -- this is because of our team of dedicated but behind-the-scenes moderators.

This is also why membership is moderated when you join -- to prevent drive-by spamming.

In a recent case, an approved contributor had his/her computer infected by malware that posted messages that they were unaware of.

We apologize for your inconvenience -- that member has been returned to "moderated" status where all posts will be reviewed before they become public.

I have also removed the original message and the series of replies that it triggered.

All good, and kudos to the moderators, but one more thing:

Sometimes, instead of someone's machine being hacked, the web-based mail server they use gets hacked instead. There is nothing on their computer. This happens a lot with gmail, hotmail, yahoomail etc. but quite a few other email domains have a web access. In doing this, the hacker has access to both their address book, and return addresses on their mail on the server, including Yahoo and Google groups.

Best defense is to change your password to a "strong" password (mix up lower case, UPPER case, numbers and special characters, and no dictionary words or common names. Change passwords from time to time, and best practice is to not use the same password on multiple accounts.

This may get you thinking about one of the password storage software utilities, where all of your passwords are stored are stored in one highly encrypted files (obligatory Lord of the Rings reference)

2975. Bicycle Mobile DXCC award

Yahoo group: BMHA
Date: 2012-11-17 00:32:27 UTC
From: Pilotti
Topic: 2975 Message: 2975

Since 2010, I have 132 countries worked from my bicycle mobile station, including some pretty rare DX, all with 50 watts or less. It all started when I worked Dave, G4AKC and saw his QRZ page. I never thought I'd get Australia or Japan from the bike from here in PA. but I recently got both and have even worked Japan several times now from my bike. It's been a lot of fun, even more fun than chasing my first DXCC when I was a new ham over 20 years ago. The best part is that nearly every person I work, near and far, tells me that they never worked a Bicycle Mobile station before. I only need to confirm 12 more to validate my Bicycle Mobile DXCC. My next envelope from the buro might do it and I have sent many cards direct in the past few weeks and they are starting to trickle back in. I'm hoping to have 100 or more confirmed by the end of the year. Do I need to send these cards to someone in the club for a Bicycle Mobile DXCC certificate?

Most all contacts are in SSB but I have made a few in CW from the bike in order to work countries I haven't heard yet on SSB. I use hamsticks for 10, 15, 17 and 20 meters, simply mounted to a rack on the back of the bike. I have no special ground and have tuned the antennas for the lowest possible SWR using an MFJ antenna tuner. Hamsticks never cease to amaze me, I can usually hear stations better with a hamstick on the bike, than I can from my home station with my Buckmaster Off Center Fed dipole that is 130+ feet long. I use 7 aH gel cell batteries that I get from the security company we use at work. They regularly rotate these batteries out of alarm panels every 3 or 4 years and the ones they remove from service are like new. I'm able to get several hours of operating from one battery, transmitting at 35 or 50 watts, before needing a recharge. You can see some photos of the setup on my bike on my page on QRZ.com.

Mike,

Great job on DXCC. That is a great accomplishment. Incidentally, I heard you make a contact on 15 meters on Oct 27 with CR2X, with a good signal here in Nebraska.

There is some work going on behind the scenes on the BMHA DXCC award. Not ready to announce yet but hopefully it will be an award that does not require actual cards, but using a log of the contacts. Hopefully soon.

I have an email coming to you off topic also.

Mike, NF0N

I received an envelope from the buro on Monday that pushed my total confirmed Bicycle Mobile DXCC contacts to over 100! As of today, 2/13/13, I have worked 134 from the bike and have 101 confirmed. I'm thinking of writing an article for CQ magazine.

2985. 2013 Dayton Hamvention BMHA bike ride!

Yahoo group: BMHA
Date: 2013-03-13 16:36:29 UTC
From: vhuntertdi
Topic: 2985 Message: 2985

Dayton BMHA 2012 Forum -- The Bike Ride

Date: Saturday May 18, 2013
Time: 1:30 PM at the Creekside Trail (see body of message)
Length: 17 miles

Hello group!

Its that time of year again... the Hamvention is getting close, and
I thought I better get some info out for those who are interested in
taking their rolling hamshacks out for a spin on the trails of Dayton.

This year, we will be doing the ride on The Creekside trail.
Check out the trail on this interactive web site for the location and
how to get there....

http://www.miamivalleytrails.org/miami-valley-bike-trails

It is a 17+ mile trail that ends Xenia. It is a very nice trail.
Paved, with restroom stops with water ever so often. There are places
to eat along the way.. Here is a site with lots of info on the trail...

http://www.metroparks.org/Parks/Eastwood/Maps.aspx

We will start on this trail at the 'north' end of the trail
(green trace on the first link interactive map) gathering at the parking
area just north of the trail around 1:30 PM, and departing on the ride
at 2PM. We will ride south a way, and return on the same trail.
Afterward we can have something to eat in the local area, depending on
what the group decides would be good place. There are several places near
Eastwood Park. The parking area / trail head is just north of the end
of the green trace of the trail on the map.

This is where the trail meets the "Mad river trail", which continues West
into downtown Dayton. We would enter the "Eastwood metro park", to get to
the parking area at the trail head, from "Harshman road",. Going South
on Harshman road from the intersection of highway 4 and Harshman, take
the 2nd road exit going west into the park. Follow the road to the
larger parking area that the road takes a right angle turn to pass thru
the parking lot. This is where we will start from.

Check it out on the Satellite view of the map to get a better idea where
this is.

A few tips...To get to the park, from Hara Arena..

Take Turner road and head east, this is a divided 4 lane road.
After a while the road will be renamed Shoup mill road, and then a little

farther on, renamed again as Needmore road. It will cross I-75.
Keep going east on the 4 lane. it will turn southward, and at highway 201
it will be renamed Harshman road. Where it finally becomes Harshman Road,
it will no longer be a divided road. Continue southward on Harshman.
After you cross under highway 4, Harshman becomes a divided highway again,
and you are just about to the park. Continue south PAST the first road
going west after hiway 4. . At the 2nd road going west, there is a stop light
(at least there was last year..). Turn west and go into the park. Then
follow the road as mentioned before into the parking area at the trail head.
Its as far as you can go into the park without crossing the bridge.

I hope that these instructions and map are clear enough for everyone..

Even so, I will be on 146.55 Mhz simplex (Not .52) for talk in starting
around 1:15 or so. Call KA0NCR if you run into problems finding the place
and need help.

Please drop me an E-mail at KA0NCR at Yahoo.com letting me know you are
planning to attend, and if you don't have a 2 Meter rig, I will e-mail
you my cell phone number. Either way we will be sure to listen for you.

I have placed an order for good weather for the ride, so I hope to see
lots of you there!

73 - Arnie - KA0NCR

2986. Re: 2013 Dayton Hamvention BMHA bike ride!

Yahoo group: BMHA
Date: 2013-03-14 11:28:25 UTC
From: Keith A Miller
Topic: 2985 Message: 2986

Arnie,
I will be back again with my trailer hamshack. I may have several of our local club members with me. I'm not sure how many will be there but now it looks like it may be 3 more. During field day my bike mobile rig was on display and used to make 3 15 meter contacts. I now have a larger solar panel on it and a VHF/APRS system that works better than what I had last year.

I will bring some snacks and water again this year.

I am sharing this information with our Goshen Amateur Radio Club on our facebook page.
See you at Dayton.

Keith, KA9RSL

2987. Dayton Hamvention BMHA Forum - May 19, 2013 - 9:15-11:15

Yahoo group: BMHA
Date: 2013-03-15 14:16:29 UTC
From: Mike
Topic: 2987 Message: 2987

The BMHA forum at the Dayton Hamvention will be May 19 at 9:15 am. I have been able to obtain the original slide show and memorabilia of Hartley Alley, NA0A, founder of BMHA and will be showing both the original slides and showing all of his newspaper articles, pictures and other information at the forum. We are billing this as the 25th anniversary of his ride although it is actually 26 years. Please bring your bicycle display as we have plenty of room in the forum room. We welcome all and any to attend and bring their bicycle. Arn, KA0NCR, is spearheading the BMHA ride again, see other post's for details.

Below is the official announcement that will appear in the Dayton Hamvention Program:

Sunday May 19, 2013 09:15 - 11:15

Bicycle Mobile Hams of America (The 23nd Annual BMHA forum at Hamvention)

Moderator: Mike Nickolaus, NF0N

Bicycle Mobile Hams of America got its start in 1989 when a QST article by Hartley Alley, NA0A asked hams who operate their radios while bicycle-mobile to get together and form a group. BMHA hosts a website along with the BMHA Yahoo Groups forum.

Mike Nickolaus ☐ NF0N
25th Anniversary of Hartley Alley, NA0A, ride to his 50th High School Class Reunion. We will be showing his original slide show and newspaper articles from 1987.
Arn Grubbs ☐ KA0NCR
Annual BMHA ride highlights and pictures

We plan to have bicycle mobile displays and demonstrations of each will be conducted.

Mike Nickolaus, NF0N
BMHA Forum Moderator

Thanks for watching everyone.

Ronny, you are the fourth person to ask about the set up in one day. I am going to have to make a video showing the set up. For now though here is some information
Trike - TerraTrike (made in Michigan), battery - 18ah gel cell, solar panel - 10w flexible (10 years old) held onto trike by two grommets that the trike's flagpoles go through into the seat. The 857D control head mount is made by RAM Mount.

From: bbqhamtrike
Topic: 2988 Message: 3002

Hi Manny

I don't have a physical list. After I take gear out to the trike I make a run through looking at the trike and how I set everything up and that does the trick. I find I rarely forget anything compared to when going to operate portable.

I don't have a two wheel bicycle so no station to worry about there.

I just want to know if my equipment is enough. I have a Yaesu VX8-DR. that is what I use for the bike events that I ride.

For the moment it is working fine, but I am always looking to make it better.

any ideas for a two wheel bike.

I do not have enough mone for another bicycle (trike) eventhough they are cool.

thanks for the fast reply.

Well Manny... I guess it all depends on what you want to do.

If you just want to talk on some local repeaters when you go out for a ride or you want to use a bike setup during a public service event... then your Yaesu VX-8DR should be just fine.

I've used my VX-7R on my mountain bike. I've put a rack on the back of my bike and a trunk bag on the rack. In the trunk bag I have a bigger capacity battery pack for the HT. On the rack I've mounted a 6m/2m/70cm tri-band mobile antenna. If I need some extra help on 2m simplex... I've been known to put my Mirage BD-35 dual-band amp into the trunk bag I used 2 pieces of coax in my setup with the 2 pieces connected with a barrel connector in the trunk bag so I could put the amp inline).

There are times in which I put my FT-817 on my bike. When I do that... I replace the band mobile antenna with an Opek HVU-100. This antenna will work on 6m, 2m, and 70cm (not quite as good as my tri-band mobile antenna) and it also has coils for 10m, 15m, 20m, and 40m (and I've cut some longer whips for the 10m and 15m coils so they can be used on 12m and 17m). I've worked quite a few states and some some DX with this setup.

I'm thinking about buying some 4/3AF cells rated at 3800mAh to make up some new battery backs for my bike. Use 30 of them (3 sets of 10 cells in series and then the 3 sets in parallel) for a 11.4Ah battery pack for my Mirage BD-35 amp and then another 20 (2 sets of 10 in series and then the 2 sets in parallel) for a 7.6Ah battery for the radios (the combined weight for both battery packs should be about the same or less than a single 10Ah sealed lead acid battery).

I haven't used my bike setup during any public service event in my area yet... but if need to... then my bike would be all set for it.

AA6WK replies:

No, we do not have member IDs (and there are two membership lists).
For this forum (the Yahoo group) there is no record of who-joined-when.

For the original membership list (at http://www.BMHA-Hams.org), the list was alphabetized when I took it over from Harley in late 2000. Since that original alphabetization, new members have been added to the end of that list.

For WD9FYF, he is record number 386 (in a list size of 737).

Actually... there IS a record for this Yahoo Group of who joined and when
they joined..

If you go to the group's "home page"... you see things you can click on
on the left (Home, Messages, Files, etc). Click on "Members". When
the list of members of the group comes up... click on the "Joined" column.

You can list members according to when they joined the group... either
newest joined first or oldest joined first. The first person listed for
joining
this group is KE4WMF on Sept 22, 2000 and the last person listed as
joining this group is WB5UEP on April 3, 2013.

Just to avoid confusion:

> I didn't see the "Joined," column after I clicked on "BMHA Members List"

Mike was describing the Yahoo group list. I think you are describing the BMHA-Hams.org list. They are separate lists (with many overlapping members).

The BMHA-Hams.org site does not display the date-of-record or sequence information that is in the database.

> I'm hoping I can update my information, specifically the e-mail address and State

This is manually updated. Send me a note (Webmaster@...) and I'll do the edit.

3018. Answers: BMHA Website now shows "Membership ID"

Yahoo group: BMHA
Date: 2013-04-05 03:30:33 UTC
From: Skip
Topic: 3011 Message: 3018

For those who share Donn's question below -- please remember that there are TWO UNRELATED lists. Joining one does not put you on the other.

This Yahoo group was started by a member (bless his soul) as an adjunct discussion forum for the (logistically separate) BMHA that was founded by Hartley Alley NA0A.

The discussion of "membership number" (there really never was one) was related to the "official" BMHA membership list reported on our website http://www.BMHA-Hams.org .

What has recently been made available is the database index (a sequential unique index for each member) for the BMHA list on the website.

So ... to answer Donn's question, he doesn't have a number because he is not in the BMHA list. He is a member of this discussion forum (and valued), but never filled out the application form on the website.

For those interested in the other list, the form is at http://bmha-hams.org/Info/Info-MembershipApplication.htm and you are welcome to send it in and be added as a member.

What does "membership" get you? It puts you into the searchable-by-state member index on the website. It puts you on the distribution list for our next Newsletter -- although we haven't published one in several years and I am not aware of plans to do another until/unless a volunteer steps forward to put one together. Past newsletters are available online at http://bmha-hams.org/Newsletter/NewsletterIndex.asp , which includes the most recent issue (April 2010).

Very good answer. Now, for me, do I need to fill out something or not...and, if so, would you
please link me in your next email and I'll take prompt care of getting on the list.
However, that brings me to the next ever-petulant question: My number should be VERY low
due to being a member as far back as 1990, running the HF net several times, actually meeting and
working with Hartley, (1991 and thereafter) and many other instances even during the recent past
decade.
Darn....my printer is currently not working.

3020. New bicycle flag

Yahoo group: BMHA
Date: 2013-04-05 19:25:09 UTC
From: Edwin R. Cortes
Topic: 3020 Message: 3020

Hello everyone,

I have been looking for a while for a vendor that can do a custom flag for my toad. Recently I found and ordered one from Dennis at Bike Flags USA. His website is http://www.bikeflagsusa.com/. I have no relationship with his business just a happy customer. The flag has the ARRL logo and callsign in both sides of the flag. Please look on the second page of my photo album for two pictures of the flag.

Regards,

Ed

Only a few weeks to the Dayton Hamvention BMHA Forum

Sunday May 19, 2013 09:15 - 11:15

Bicycle Mobile Hams of America (The 23nd Annual BMHA forum at Hamvention)

Moderator: Mike Nickolaus, NF0N

Bicycle Mobile Hams of America got its start in 1989 when a QST article by Hartley Alley, NA0A asked hams who operate their radios while bicycle-mobile to get together and form a group. BMHA hosts a website along with the BMHA Yahoo Groups forum.

Mike Nickolaus ☐ NF0N
25th Anniversary of Hartley Alley, NA0A, ride to his 50th High School Class Reunion. We will be showing his original slide show, newspaper articles and his notes from planning to completion of his trip in 1987.

Arn Grubbs ☐ KA0NCR
Annual BMHA ride highlights and pictures

We encourage anyone to bring their bicycle mobile displays, our forum room is large and can hold any display you wish to bring.

The BMHA ride is again on Saturday May 18th.

We will have complimentary copies of Adventure Cycling magazine along with a number of complimentary vouchers for membership.

Mike Nickolaus, NF0N

3025. BMHA Hamvention bike ride - 2013..

Yahoo group: BMHA
Date: 2013-05-11 04:56:33 UTC
From: vhuntertdi
Topic: 3025 Message: 3025

Hi Group,

Well, its about a week away.. so I thought that I would put out
another reminder about the BMHA Saturday afternoon bike ride.

Here is a link to the info on the BMHA web site...

http://bmha-hams.com/Timely/Dayton2013.htm

Other than having my name spelled wrong, its got all the good info.

I have ordered good weather for the day, so I hope that the weather man delivers.. And that we have a good turn out again this year.
This year its about 1/2 hour later start time than last year..

I am not sure which bike I will be running this year, as it has been cold and rainy here most of "spring" so I don't have much for miles.
Will either be running my little folding bike again this year, or will
bring the LWB recumbent. The latter would be better on my
un-prepaired seat-system!

Hope to see you there!

73- Arnie KA0NCR

I won't be bringing the Salsa with the bob trailer and HF rig this year. Used that bike last weekend for the Bear 100 gravel road race in Wisconsin last Saturday and need to clean it up good and work on the derailleurs. By the end of the race it was a single speed bike. Got home yesterday and don't have time to do the service before leaving for Dayton on Thursday. This year I will be using the Specialized Secteur and have the VX8G for VHF/UHF and APRS.

Not to rain on anyone's parade, but units that are already built and made in nice sleek cases without the clunky "kit" look are available at similar prices at Wallyworld and elsewhere.

Best,
Sonny N1KHB

Seeing as no one has come back to you I might just as well, if your trike has a back carry platform put everything on it such as batteries and a mag mount, make a good ground to the frame, if using a radio with a head unit make up a plate to hold it across the handdel bars, you could have a headset with VOX or a PTT to hand, do not wear a head set your never hear that 30 foot lorry coming up behind you, try a 2m handy and see how that works out go to the highest point where you live. Good Luck. Mike M3EMB.

I have a Sun EZ Tadpole. Its a good street cruizer. As far as rig location goes (which I have not done yet beyond carrying a 2m HT...) the back of the mesh seat would be a good location for a small rig (ie an 817).
Id be curious to hear from others though about the antenna.

Hello Tom,

My call is K4BQN, please take a look at the Photos section under my callsign and you will see my old setup. I am in the process of setting up a new configurations, since I have a KX3 now. I normally carry an HF QRP and Handheld on my trike. I setup the antennas in the back rack and so far has worket fro me. Also look at K6BBQ I believe is his callsign in Youtube he has done a lot of operatting from his tadpole.

Best of luck and if you have any questions feel free to contact me off line at K4BQN dot ATTL dot net.

Regards,

ED

From: bbqhamtrike
Topic: 3035 Message: 3040

Tom,

I just saw this thread, I get the daily digest. I use a RAM Mount system (ball mount that connects to the left outrigger/arm of the trike) and a gooseneck that connects. Connected to that I use RAM Mounts Icom 7-06 mounting plate that I attached velcro to so I can hold the mobile mount for the FT-857 that I use. That means I also have the whole mobile kit for the 857 with the longer mic and remote head cords. The 857 sits in a back pannier as does the battery. I use a solar panel to help top off the battery. The Buddistick antenna is mounted on an aluminum plate at the back of the bike rack.
If you want to see what it looks like search my videos for tricycle mobile and you will see some shots of what this set up looks like.
I am not on VHF, just an HF antenna.

Please share your pictures or videos when you get your system up and running.

And so we all wait my friend!!!! in the meantime here are a few that I have found from MFJ what I do not like about them is there mostly crossed needle types the numbers are 901B - 902B - 902H - 904 - 904H - 941E - 945E most of these look to be the size as in long - deep and wide as my Yeasu FC 700, what I am myself looking for is a ATU without a needle window as I have the pocket size WELZ swr-pwr meter. I think I have seen a gold looking MFJ but I have forgotten the number, surely there must be other pocket size ATU other than MFJ ones, I think we need a maker man open to make some money don't you. Mike M3EMB.

3043. The most used MFJ - ATU

Yahoo group: BMHA
Date: 2013-05-28 19:10:07 UTC
From: michaelrae65
Topic: 3043 Message: 3043

It would seem from the web that the MFJ 949E is the most used ATU, there s also a link to a few nice mods like getting a better tune up on 1.8 as at present the 949E can't quite make it.
The MFJ 971E is quite small about parm size, not sure how well it loads on 1.8
A close third MFJ tuner is the 945E can it get to 1.8 MHz.
Other brands there is the very small Emtech it came on the KIT marker as the ZM-1 it would seem the ZM-4 has many improvments making the ZM-1 a VERY cheap buy with you making your own mods.
So there you go I did your with out me moaning as ha been directed towards me in other groups and the reason why I left those groups, words like can you not do a Google or is your PC working. Mike M3EMB.

As for the headset idea. I use a boom mic headset with all my mobile and Bicycle mobile installations. The headset is designed to cover only one ear allowing me to hear the traffic around me. My PTT switch is tie wrapped to the handlebars allowing me to use it with my thumb. My hands do not have to leave the handlebars. It is both a monetary and a lock on PTT switch. Additionally the earpiece allows me to hear the radio much better than a speaker.
Good Luck

These are all great points.

Having traveled thousands of miles on my long wheelbase RANS recumbent (as well as the entire east coast trip from Canada to Key West Florida), a setup similar to below is what I ended up with as well.

Hand mics are way to dangerous on a bike if you hold them.
Why, they take your hand off the steering bars, and if you drop it (in the case of an emergency turn or brake) the darn mic and cable can get caught up in the chain or tire. I know this from experience. Having a HT come flying off a clip mount on the handlebar towards your face as the speaker mic cord is getting stretched and wrapped around your rear wheel.. not fun.

Keep the PTT mounted on the handlebars and it is one less thing to have to think or worry about.

A speaker is nice, but hard to hear over about 14 MPH with the wind noise, and impossible to hear when in traffic. One ear (I went with the right ear, so I could hear traffic with the left) is a good compromise.

A boom mic off the one ear will is good, again when traveling under about 14 mph. Over that speed, the wind plays havoc on the mic element, unless you add a ton of foam to it to cut down on the noise.

Hamming is fun, cycling is great fun. Crashing from trying to do both, not so much fun.

Stay safe out there all!

Jay N1RWY now living in 7 land, where one can bike ALL the time!

3048. Kite Antenna.

Yahoo group: BMHA
Date: 2013-06-01 11:09:43 UTC
From: michaelrae65
Topic: 3048 Message: 3048

Went for a walk in my local park The Prom in Maldon Essex UK, and saw a car and and guy flying a kite so went over, he was working top band from a home brewed tx in AM, it would seem he is a member of the Dengie Hundrad yes spelt that way, so do we have any kite flyers in this group if so are you on Top Band or any other band in what mode.

I have used a 6 foot Delta to lift 148 feet of Gibson Girl woven bronze wire. I connected it to a TenTec Argonaut II and worked several stations on 40 meters. Don't use it often however, if I go camping the kite and antenna do go with me. A 50 ohm bleeder resistor from the antenna to ground keeps helps with the static electricity.

Hi Jim,
50 ohms? Why so low? I usually think in terms of 100's of K - possibly higher for bleeder use.

3054. RE Kites

Yahoo group: BMHA
Date: 2013-06-02 16:15:18 UTC
From: Jim Bassett
Topic: 3054 Message: 3054

I used 50 ohm resistor because that is what I had in my junk box at the time.

The Gibson Girl wire I got from an Army Navy surplus store. They had sold the radio and the extra spool somehow got left behind so they sold it to me. Otherwise you might try ebay or a speciality wire store. The wire is a bronze weave around a nylon string. The main concern is the strength of the wire for the wind conditions you intend to operate in. This particular wire was designed light weight as it was dual purpose. When the wind was over 13 MPH they connected it to a Box Kite. Under 13 MPH they used a balloon to lift the wire. The radio also had 10 feet of wire attached that was dropped into the ocean for the ground/earth connection. You can search the internet and see the particular on the Gibson Girl Emergency Radio.

I tried a box kite in moderate wind condition and it stayed very low to the ground. The Delta kite in the same wind conditions took the wire almost vertical. Unlike others, I do not use the antenna wire as the Kite control string. I use the appropriate strength kite string for the kite in use. This does require the kite to life a little heavier load. This is done due to the age of the antenna wire. I believe the wire I have is left over from WWII. I have not tried the kite that Marconi used however when I do I think I might have to use a 9 foot model at the very least.

A group of ham made a pair of Sled kites out of a plastic type material that is used to wrap around the basements of house when they are built to keep out moisture. I think it is call Tyvex or Tivex. They made the two kites 9 feet wide. Used extremely strong kite control lines. The reason they used 2 kites is each one held up the opposite end of a full side dipole for 160 meters fed with ladder line. There should be an article somewhere on the internet about this Field Day 160 antenna.

Good Luck

You hit the nail on the head.... handhelds are best used for across-the-parking-lot QSO's though they are BETTER THAN NOTHING wheen you are on foot, on bicycle, etc.
Even hitting repeaters with handhelds is not easy in today's world where most repeaters are located close to other transmitters, with lots of desense overpowering the weaker signals.
I use handhelds both hiking and biking, and have good luck with them.
The rubber duck is THE problem with a handheld. If the antenna was large enough to be useful you would be whacking everything and everybody with it as you or they passed by. I use bicycle flag poles as "J Pole" antennas for both 144 and 440 MHz, but even with the tall J pole I have learned that few will hear me on simplex. I still give them a call anyway, and on the rare occasion that someone hears and answers me I know they are either (1) very close to me or (2) have superior stations or (3) don't set their squelch so tight weaker stations cannot be heard.

What's everybody up to on Field Day this year?
Taking the IC 706 out this year again for some 100W bike mobile. Get some Qs and log a few miles on the bike. My usual antenna is a 102" spring mounted whip along with an AH-4 tuner. Setup doesn't work so good on 75 sooooo ... added a Texas Bug Catcher for this year's FD. Makes things a little off balance while in motion. With a 4' mast, the big 480 coil and the 102" whip of the top I'm afraid the torque on the 3/8 x 24 core will snap it off. Probably just park it on the patio at night fall and work stationary.
Goal this year in 1C is 300 Qs and 100 miles - same as the last 12 years - if I make it I will spend next year in a nice mosquito free tent with serving wenches providing the brats and beers. You guys in class A and B have serving wenches and air conditioned tents, right?

Hi Mike,
Either your antennas are faulty or misadjusted, or check that the power you think is 5 watts actually is. Handhelds are typically good for multiple miles/kilometers especially on 2 meters depending on terrain with a decent antenna. Some investigation of either of the two issues which I described will very likely find fault with at least one of them. Perhaps you can borrow a known good antenna for starters, and do the same with a VHF/UHF RF wattmeter and dummy load. Keep at it and the problem will be discovered in due course.

Best,

Well, the thing is this...you may not have been heard at all. Hand-held radios are usually limited in
power output to about 5 wts. That only means you benefit with repeaters as an in between machine
that amplifies the low wattage of the handie-talkie and increases the effective range of the HT.
You did the right thing in trying to get some elevation for your HT but that's not a guarantee.
The rule is usually stated as "line of sight antenna". Also, if you're not TXing the correct control signal
on top of the audible signal for access to the repeater there will be nothing happening until you do.
Sea water, fresh water, dish water, well water....not significant in your situation receive or transmit.
Bar indicator, meaningless. What means something is the ears on your head...you heard them, they apparently didn't hear you. Its always possible they were busy and didn't hear you or ignored you for whatever reason.
The best use I have ever found for a hand-held is to keep on in the car with its charger and do a lot
of listening...in other words, HT's are terrific for SHF Days and almost pointless for much else.
HTs' have great sensitivity and perfect for listening but not good for TX long VHF/UHF distances.
Still, understanding the range of the radio is essential to using it well.

Hi Sonny. I put in a line tester on all my rubber ducks and there is no faults, I even have used my base station antenna a Diamond 2000, its a tri bander and I still cannot get to the repeator with 3.5 or so called 5 watts with about 8 watts I can, the problem therefore is power to these rubber ducks or pull up telescopics there so bad.
A handy is useless at locations here in England I think we have a bad layout of repeators, as unlike the US.
We normally have them every 30 miles if your lucky in some towns and even city's none at all, some even turned off due to the IQ zeros using them.
Whilst in Surprise AZ I was told there were many up on Tank Mountain {Hills that look like a convoy of tanks across the sky line} you even have 220 we do not have that here and with this handy set to the US version I could get into the 2m ones, in fact if I recall 3 or more and most linked together just walking in the streets and what a range those links had.
Apart from mounting a large something on a bike there is no way this 3.5 watts is going anywhere in almost any European location, then again when its a SOTA event no one takes a handy to go mountain topping, here its a car unit and a battery and a SOTA beam maybe that's what I should use on this handy directed RF power, the funny thing is a 3 watts CB handheld can get to stations 8-10 miles quite well on a rubber duck so frequency matters as well. Mike M3EMB.

Something to remember is that the rubber duckies that come with handhelds are often useless, especially the ones with dual and multi-band radios. You will get much better results with a replacement antenna from a good maker such as Diamond.

Hi Don. All points covered, the thing that gets me and I am sure all buyers is the cost of there things we must have one, no wonder we are seeing imports from China its the way to go, as why would you want to spend {in $s and I maybe way out as I use sterling or euros} $150 or more when you can get a great LISTENING unit so called 2m handy for $75 or even less, all my other postings say a lot as well, seems I have woken the handy must havers up here LOL, there USELESS there only good for foot leg mobile into a re-transmitter if you can reach it. M3EMB.

Mike. Have you tried a sigle radial lead on the ground side of one of you Duckie antennas? See if it makes a bit of difference REF this link http://www.hamuniverse.com/htantennamod.html

Worked better for me.

Hi Ronny. I have used that idea a rat tail or the other half on the supplied rubber duck of about 24 inches it did very little for me, but not on the 56 inch one worth a try.
 How much time one spends in charging a battery pack only to have one watt going out, in that write up, or less as can be in the real world what a rip off.
Some buy a handy to be used as a semi base station, some even stick 40 or so watts on its output now that's great and if like the Yeasu FT 727R it has the tone board in it {a lot do not} and your other base station has no tone system then it become a good unit.
One could use the above in a back pack but as I said I have never heard or seen in any mags anyone doing that on a SOTA day. So our eyes are being opened here thanks to you all, and so how many handheld do YOU own and was it worth the money. Mike M3EMB.

Around here, we refer to Rubber Duckie antennas as "rubber dummy loads". I almost always replace the antenna that comes with the radio with a third party antenna with better performance. The antenna that came with my radio had a gain of 0dBi. Electrically, it was a shortened quarter wavelength antenna with no ground plane. The antenna I use now is still a shortened antenna, but at least now it's a half wave antenna, so the lack of a ground plane doesn't matter.
Most of the time, the radio sits in the handlebar mount on my bicycle, and feeds a mobile whip mounted on the rear carrier. I'm getting usable ranges of 5-10km when working a mobile station directly, and double that if I'm going through one of the local repeaters.

3068. Re: What use is a handheld

Yahoo group: BMHA
Date: 2013-06-18 13:48:30 UTC
From: Jim Bassett
Topic: 3068 Message: 3068

There are lots of factors on this subject. Many have already been covered. I've had the good fortune to use handhelds from aircraft, ships at sea, bicycle mobile, automobile mobile, from my home and on mountain tops.

Aeronautical mobile was more than adequate (and lots of fun). I once brought up a dozen repeaters with 1 watt from 25,000 feet.

Maritime Mobile at sea it was perfect to hit a repeater 50 miles away to get help for an injured crew member. Line of sight...nothing in the way

Mobile from my car I used the duck inside with less than good results as expected. I've used a window clip and put the rubber duck just outside the car with good results. Lastly connected it to either a 1/4 or 5/8 wave magnetic mount or permanent mount with better results.

Bicycle mobile I use a 1/4 wave vertical on the rear rack and with just that little improvement in antenna and I can hit most of the repeaters within 30 miles. Some better than others. I've also mounted the 80 inch Hustler Collinear on the rack with great results. It even make the bus drivers move over a lane when passing me. Recently I was the bicycle unit at a foot race in the downtown area where we all operated with rubber ducks on a close in repeater.

My last job I was a technician and got to travel to many of the mountain top and hotel repeater sites. I found that the repeaters I had a difficult time communicating with were installed in sites that were less than optimal. Site that were overloaded with towers and antenna. One site had over 100 antennas mounted on the roof of a building at the same level. Also different sites used different radios. Some were more sensitive than others. We have a repeater in town that is real sensitive and works really well for those on rubber ducks. Another repeater located with about the same amount of exposure to the city is almost useless for rubber ducks to access. Depend on the quality of the equipment and the technician installing/adjusting it.

The limitations of the rubber duck are a factor so is the repeater system you attempt to access. The terrain surrounded you can limit you drastically. In Viet Nam radio operators learned the difference when communicating under dry and wet jungle conditions. RF absorption in the jungle created massive problems.

Simplex operations are of course more restrictive. Although 25,000 feet above the earth in an airplane 146.52 MHz can be a lot of fun. I have worked over 1000 miles during an incident of thermal ducting. In my area of the USA simplex is go up to 15 miles. When I go to visit my parents back east it is good for 3 to 5 miles depending on what part of town I'm in during the transmission. I have a second antenna that is sometimes used in place of the rubber duck and it is a telescoping 1/2 wave. The improvements with just that antenna are very obvious.

Know the limitation of ones equipment allows for less frustration in the field.

Good Luck,

One of our field day sites is in a city park, NO tents, NO wench, and NO alcohol allowed. In the desert we don't need tent as we don't have any bugs to bother us at 100+ degrees F. hi hi
The 2nd site is on the side of a mountain an I'll go check that one out this year. It is reported they have better food. HI HI . ...
I'll be operating either a 3A or 4A station.

Mike,

I have a thin flexible antenna (similar to the MFJ Superflex http://www.mfjenterprises.com/Product.php?productid=MFJ-1715) that I built homebrew. I tested my antenna using my HT and hit a repeater 70 miles (about 112 km) using 100mw. My son and wife both use the same antennas to communicate in our Utah mountains when he hikes. They could successfully QSO at distances of 20 miles (32 km) using 5w power. Non-hams were very surprised at their communication success and often asked questions about the radios and what was needed to obtain one. (It was EXCELLENT ham PR.) My homebrew antenna was made with a single stiff wire (cut to about 19.25 inches or 49 cm) that was soldered into a BNC connector. I covered the wire with shrink wrap to prevent rust. (We all still use these antennas each time we take out or HTs.)

Good luck,

Glen

Hi Glen. Yes you can home brew just get that bottom section like you did and solder on that 19.25 inches bit of wire to the central pin {on the BNC plug} I have done this and also used heat shrink but I have no mountains here LOL and that would work that is why repetors are up at a high stop looking down at us that want to use a handy the way to go. 73s Michael - Mike.

Ron,

You are going big with doing 100 miles and those antennas! I thought an ATAS-120 was heavy, I can't imagine a Texas bugcatcher. Well you will pull in the signals and get your signal out. Great setup although it does sound heavy. Best of luck, I know you will do well.

You are the reason I started doing trike mobile for field day. I will be tricycle mobile again but only during the daytime Saturday, no 40 meters and no 75/80. I don't think I will get 10 miles in and less than 50 QSOs. It will be fun though.

What's different this year for me is I will be visiting the county ham club and camping there which is at one end of the bike trail I operate from. Camped there before, great views North of the bay and usually a good breeze late day. That way I can catch up with some people I haven't seen, sit around have dinner, talk and watch them operate their stations - three towers with Steppir beams.

Everyone have a fun field day wherever you are,

Rem
K6BBQ

My usual antenna is a 102" spring mounted whip along with an AH-4 tuner. Setup doesn't work so good on 75 sooooo ... added a Texas Bug Catcher for this year's FD.

With a 4' mast, the big 480 coil and the 102" whip of the top I'm afraid the torque on the 3/8 x 24 core will snap it off. Probably just park it on the patio at night fall and work stationary.

From: S. Earl Jarosh
Topic: 3056 Message: 3073

That is a good radio and I kept the antenna off mine for future radios as it was a good rubber duck. 8 watts with the amount of bars you get tells me that the repeater was deaf!! I live west of Minneapolis, MN and have never had a problem getting into the repeaters here 30 miles away. We are at roughly 800ASL with no mountains. Move here, lots of Brits in MPLS and repeaters that work. Biggest mistake made on repeaters is to not use ctcss and turn up the squelch to eliminate the noise. Not all repeaters are installed and tuned by highly technical people. I know that sometime back ctcss became mandatory on new repeater installations in the UK. If you guys are still using the audible Tone Burst system over there that was somewhat unreliable to kick the repeater the first time(the whistle up process).

There is a repeater in Hudson, Wi 30 miles as the crow fly's and at lower asl. Back in the day I could key it with my FT470 but had a hard time holding it. I built a jpole with 12 gauge solid electrical wire tacked to a board at 10 ft with 20 ft of coax. After that full Q. If you can hear it full Q then you should be able to get into it. 30 miles is on the edge but 15 miles is certainly within reason. All the Yasue and Kenwood HT's that I have own had tended to be a little hot on the deviation and I had to pull them back a little on the service monitor. Ht to Ht will tolerate this but not so for a properly tuned and installed repeater. For wide band you cannot exceed +/-5Khz deviation with the ctcss tone and on narrowband it is +/- 2.5khz the ctcss needs to use 10% of the deviation.

Hi Sonny. I put in a line tester on all my rubber ducks and there is no faults, I even have used my base station antenna a Diamond 2000, its a tri bander and I still cannot get to the repeator with 3.5 or so called 5 watts with about 8 watts I can, the problem therefore is power to these rubber ducks or pull up telescopics there so bad.
A handy is useless at locations here in England I think we have a bad layout of repeators, as unlike the US.
We normally have them every 30 miles if your lucky in some towns and even city's none at all, some even turned off due to the IQ zeros using them.

Whilst in Surprise AZ I was told there were many up on Tank Mountain {Hills that look like a convoy of tanks across the sky line} you even have 220 we do not have that here and with this handy set to the US version I could get into the 2m ones, in fact if I recall 3 or more and most linked together just walking in the streets and what a range those links had. Apart from mounting a large something on a bike there is no way this 3.5 watts is going anywhere in almost any European location, then again when its a SOTA event no one takes a handy to go mountain topping, here its a car unit and a battery and a SOTA beam maybe that's what I should use on this handy directed RF power, the funny thing is a 3 watts CB handheld can get to stations 8-10 miles quite well on a rubber duck so frequency matters as well. Mike M3EMB.

Hi Earl. Yes I like the Yaesu FT 727r its a keeper, the repeater I am sure has a problem, it has a very long hang time, some days it works well over days its doing its thing on its own, need a good 4 pound hammer to it and a lots are saying that, the thing is where it is, this news I have only been told as of today, the rentel site cost has doubled and the owner is not going to pay it, so it is left with all its problem till that site paided for time runs out, as I side we have one such unit per town some have none, your get very surprised if you come to the UK it is not as good a layout as the US that's for sure, in central London there are NO repeaters as there been turned off due to the music players and blockers.
I have no idea where you are but sounds great, if the UK guys are there they must have found Ham Radio Heaven, so where are you, and where is my bed. My first trip to the US got messed up when I missed my connection the PA was not working and so someone went to find me I was looking at a wrong timetable and so missed my flight I had to sleep in a chair till the next day and got fined $250 which months later I got back so I have a credit note for that. I read that the deviation is off on the FT 727r but not being able to get it spot on I use it as is, this crap repeater has in tone burst off 100.9 so no whistle up required. I am going to use my bike as I am thinking metal under me and mount a J pole on it and see it that hits it, I was also told to set the handy to 12.5 which I have done so either my handy is off or the repeater is really at fault, and so I wait for it to be moved, I have also been told it well be lower, yes been told a lot about this
pest. Mike Michael M3EMB. Maldon Essex UK.

3075. RE: [BMHA] Re: Field Day

Yahoo group: BMHA
Date: 2013-06-18 22:47:18 UTC
From: Ron Baran
Topic: 2059 Message: 3075

Hey Rem,
In the past I've tried all sorts of mobile antennas on 75 Meters and, although they all had a low SWR, none of them radiated very well and I couldn't score a Q on that band. The efficiency of those antennas were in the range of 3% if memory serves.
I got a taste of what I was in for when I screwed the 3/4 x 24 lower mast into the spring - bent it right over and I had to make a spectacular catch before the coil hit the ground.
The over all height of the thing mounted on the luggage rack is a little under 15 feet. If I had a little more time to play around I think I would have substituted some of the lighter BuddiPole antenna sections to the bottom of the Catcher.
When I operate 10/15/20 during the day I'll use the 102" spring mounted whip and the tuner while in motion and then take the spring off to put the Bug Catcher on. I don't plan to do a lot of riding with that antenna on because it is pretty unwieldy and it will be dark when I finally get on 75.
If this works out I can beef up my Qs by getting to operate another band while the higher frequencies are shut down ... or not. Might very well end up as just another dummy load for my junk box.
Three SteppIR beams of towers! Yow. I'm putting one together right now - a two element with the 30/40 meter trombone. Either it's me and I'm getting stupid in my dotage or somebody doesn't know how to write a manual and count out the right number of parts. But, if it's already been done it's probably possible. Thank my lucky stars for YouTube.
Sounds like your plans will be a lot of fun. I'll be looking forward to watching your videos.
73,

Ron

Did I miss a mention of the correct tone being used? Without the
tone, no reasonable amount of power or signal is going to bring up the
repeater..

I will be working the call sign K7UGE this field day as one of the two CW operators at our location. If you hear us give us a call. Yes, we will have lots of SSB operators on during the day. I usually show up to help set up. I leave during the hottest part of the day and let the youngsters handle those hours. I come back later in the evening and operate when it is cooler. I'll be on mostly after 0001Z Sunday.

Thanks and so everyone knows....St. Louis area has been putting in some terrific trails for the last ten
years or so and we now have many wonderful Missouri and Mississippi Rivers trail rides on beautiful
paved paths from way north of St. Louis to way south.
www.Trailnet.org (http://www.Trailnet.org) & on Facebook at _Trailnet - Saint Louis, MO - Non-Profit Organization | Facebook_ (https://www.facebook.com/Trailnet)

Years ago, before we had our own special trails, I rode many of these on my Nishiki Tour and you
could easily find places to drop a small tent, cook a little and move on in the morning. Back then,
did many Double Centuries.
Now, still easy but the ride is just plain better thanks to the organization that funded everything, Trailnet.

From: michaelrae65
Topic: 3080 Message: 3080

Using a Alinco DX-70TH set on 100-50 Watts setting and using two 12v @ 17Ah in parallel batteries and just running in the 50 watts setting in SSB what talk time can I expect guys and gals!
I have been looking for a on line calculator regarding this yet to find one, I am sure someone will ask How long do you normally talk - my answer is more than a rubber stamping so I would say 3 mins per contact next your going to ask 25 contacts in an hour LOVL well I should be so lucky.
Of course there will be a lot of listening, so if you have done the /BM how long were you in the field or by the seaside. Michael BE.

Seems like you've answered your own question. There are so many variables to consider. You have already hit on the main ones. How many hours do you intend to be using the radio? Are you going to be in receive mode 100% of the time during this period? How much power does your rig pull in receive mode? What type of battery are you using? As a rough guess with your battery setup I feel that you could run 6-12 hr.s (using AGM type batteries) at 80% receive, 20% transmitting at 50 watts SSB. You can maximize the duration by using big short cables between the batteries and the rig. Also minimize or turn off back-lighting on the display and use headphones instead of the built in speaker. I have run my Yaesu FT-897 for 4 hr.s 90% receive 10% transmitt at 100 watts SSB with only one17 Amp/Hr battery but I was draining it below the recommened voltage level which will effect battery life. The only way to know for sure is go out and try!!

Hope this helps.

Randy

hi Randy. Your reply ties up with KF3CD reply he runs about 40 watts /BM from a 7Ah battery and gets 90 mins talk time which is a very good guide line, I must admit I never was thinking about short power leads lol but distance over power would help!!! it always has been said that for building any FM gear keep all leads short so it must tie in with that. Coming in from China Where else is a LED battery voltage indicator I was also told that contacts will soon tell you if your sounding strange as a indicator that your battery or two in parallel is losing power so time to pack it in for the day, I think 3-4 hours is more then enough at our present temps of 87-97 as predicted but I will have a lot of water and a black umbrella . I may very well use headphones. Thank you for your advice. Now if this silver surfer aged 71 can put up a few pics I will do that, lets hope I can as never done it before. Michael M3EMB my brother is G8YXL Norman so he may come alone as well but he is into VHF. Mike.

From: g4akc_mobile
Topic: 3083 Message: 3083

Hello All,
Several of you may have spoken with Pete, G6UOI who was a very keen HF bicycle and pedestrian mobile operator over here in the northwest of the UK and could be heard most days working VK and ZL using his back-pack or bicycle set-up and he was also a keen member of the Yahoo" Real HF mobile" group.
I was devastated to receive the sad news that Pete who was only 53 years old has had a major heart attack and has passed away.
Pete will be more than missed by all of us, he was our rock, and many of us looked forward to getting out on the beach and working alongside him, his enthusiasm for our side of the hobby was amazing and infectious and no matter the weather or the band conditions, Pete would be there always with a cheery voice and lots of humour, making the whole experience for everyone something really special.
His wife Sue, his young children and his constant companion Kobi the dog were very special to him and our hearts and prayers go out to them.
Pete was one in a million and a very special friend to all of us, we will remember him always and I am sure he will be listening to us up there on 20M with a golden aerial. Dave Starkie, G4AKC

3086. ATAS-25 on a bike???

Yahoo group: BMHA
Date: 2013-10-01 19:00:54 UTC
From: n1evh@verizon.net
Topic: 3086 Message: 3086

I'm sure this is a long shot... but has anyone ever tried to use the Yaesu ATAS-25 on a bike???

Right now I have my bike setup so I can use my FT-817 on it. My current antenna is an Opek HVU-100. It covers 6m, 2m, 70cm, and it had HF coils for 10m, 15m, 20m, and 40m (I've cut longer whips so the 10m and 15m coils could be used on 12m and 17m).

The problem with this antenna tho is... if I want to chance HF bands, I have to bring all of the HF coils with me when I go out on my bike (and the 40m coil/whip is a bit long to fit in the bag that I have on the back of my bike). I figured with the ATAS-25... I would just have to stop and manually tune the antenna for another band.

Also... for HF... the ATAS-25 is advertised for 10m, 15m, 20m, and 40m. Can it be tuned to use on 12m and 17m??? I don't see why it couldn't be.

So... if anyone has tried to use an ATAS-25 on a bike... I would love to hear how it worked out (good or bad). If I knew anyone close to me that had an ATAS-25... I would borrow it and try it out... but I don't know anyone with the antenna.

Thanks,
Mike - N1EVH

Hi Mike,
Is there any reason that you wouldn't want to try an 8.5' SS whip with an autotuner for ~ the same total price such as a Z11 Pro instead (upper VHF bands covered seperately)? Just a thought since such a setup on a car works great. No manual band changing - just talk.

Best,
Sonny N1KHB

Well if the upper VHF bands would have to be covered separately
(ie: need a second antenna)... does this mean when I leave the house
on my bike... do I put the 8 1/2 foot antenna on the bike and carry a
VHF/UHF antenna with me... or do I have the VHF/UHF antenna on
my bike and I carry the 8 1/2 foot antenna with me???

I would like to use 1 antenna to cover all bands... or something that
can easily be changed for other bands.

With the Opek HVU-100 antenna that I have now... 6m, 2m, and 70cm
is always on the bike. I can easy swap coils/whips for 10m thru 20m
with no re-tuning needed (usually have the 20m coil on... but do swap
it out for 10m and 15m from time to time).

The ATAS-25 also covers all of the bands. I'm sure once the initial
setup/tuning is done... labels can be put on the antenna to allow me
to get into the ballpark for SWR... and then fine tune the SWR using
the FT-817's built-in SWR meter.

Also... wouldn't a 8 1/2 foot stainless steel whip "sway" and put a bit
of strain on the antenna mount. A bike mount for such a antenna
wouldn't be as sturdy as a car mount.

Hi Mike,
I don't see any reason not to have the two dedicated antennas in place for ops. They probably should have some space between them though. The split RF outputs of the FT817 are ideal for this anyway. As for mount stress, I can see where any HF antenna would transfer some movement inertia to a mount. If it isn't a (lightweight) whip, then it's coils, etc. Base springs may help absorb inertia as also used on motor vehicles.
My bike has a rather sturdy welded aluminum rear rack that I would consider strong enough for such purposes. It attaches in the usual way with the weight bearing supports bolted to the threaded rear axle plates with M5 screws. Previously, I had mounted an even stronger homebrew rack made of aluminum bar stock, but it I never liked it enough aesthetically so the official bike rack was purchased. I can't give you a brand name because I got it at a bargain without label or hardware. I keep all sorts of screws and nuts, both SAE and Metric at home, so no problem there.
I haven't made the HF plunge as yet on bike, but I expect that I would mount an HF antenna and battery on a stripped and partially converted tricycle kiddie carriage to use as a trailer that I've been working out a hitch for. I need a place for a cooler of food and drinks anyway. The autotuner would be there as well at the antenna base. The extra length of bike and trailer together will surely improve the counterpoise. I've also heard some rumors that Newcastle in the cooler will help Z matching. :-) :-)

Best,
Sonny N1KHB

Regarding the question of long whip sway. I used the 80 inch Hustler 2 meter antenna on my bike rack when I was commuting to work. Yes, it did sway and it also was put up to force the bus drivers coming up behind me to move over when lane when passing me.

I have seen the 102 or 108 inch whips (CB style) mounted on a bicycle. However, the mount I saw was at axle level, behind the bike like you would see on a motorcycle trailer hitch. Additionally, the auto tuner for it was in a box hung down from the side of the rear rack. (Like a solid saddle bag). The other side of the rear rack had a second box mounted the same size as the tuner box and it carried a rechargeable battery pack, charger and VHF amplifier (30 watts I think). The owner could park the bike near an AC outlet, open the top of the weather proof box and plug it in to recharge it. With this setup the owner also had a dual band antenna mounted on the rear bike rack. In one of the boxes he also carried some light wire that he would clip to the ground side of the antenna system and throw out on the ground for radials when he operated HF from a stationary location.

I don't have any experience with the ATAS-25 antenna. I don't see any reason why it wouldn't work as long as you have a strong enough mount.

Mike,

How about the Opek HVT-600?

http://www.universal-radio.com/catalog/hamantm/5578.html

It covers 80m through 70cm including 30m, 17m and 12m. For 80 bucks it's hard to beat. It is sort of a lightweight version of an Outbacker antenna. I have both a Perth Outbacker and a Opek and when I did a quick comparison of the two in my driveway with the antennas mounted on an old satellite dish tripod about 4 feet off the ground and four ground radials of 45 foot length the Opek was always 1 to 2 S units better on all HF bands. Surprised the heck out of me as the Opek is a lot lighter weight than the Outbacker! I did not test anything above 10 meters.

The Opek will mount on a standard SO-239 mount and the whip is removable. The only issue with this antenna is the poor whip to coil mechanical connection, as noted on the eHam reviews. I solved that problem with a "Wire Reducer Wire Connector". Looks funky but it works. They may have improved that in the newer antennas but the in picture it still looks like my older one.

http://www.lowes.com/pd_36042-12704-770143L_4294722554__?productId=3128695
<http://www.lowes.com/pd_36042-12704-770143L_4294722554__?productId=3128695&
Ntt=ideal&pl=1¤tURL=%3FNtt%3Dideal&facetInfo>
&Ntt=ideal&pl=1¤tURL=%3FNtt%3Dideal&facetInfo=

The Opek will be a lot lighter weight than the ATAS, is a lot cheaper, has no moving parts to go wrong, will be a lot less stress on your bike and will help you keep your balance and controllability by keeping your center of gravity lower.

I really do like the screwdriver antennas when mobile so I don't have to stop to change bands but on your bike you should be able to change bands by just reaching behind you and moving the "Jumper Lead". Sounds like a good YouTube video to make while in motion!

Let me know if you have any questions about my experiences with the Opek or biking with antennas.

73,

Charles WA5VHU

I have the MFJ version of this antenna (MFJ-1899T) for use with my FT-817... and I'm not all that impressed with the antenna. Never really able to get a decent SWR... even when using various ground radials with the antenna.

Mike,
How about the Opek HVT-600?
http://www.universal-radio.com/catalog/hamantm/5578.html

It covers 80m through 70cm including 30m, 17m and 12m. For 80 bucks it□s hard to beat. It is sort of a lightweight version of an Outbacker antenna. I have both a Perth Outbacker and a Opek and when I did a quick comparison of the two in my driveway with the antennas mounted on an old satellite dish tripod about 4 feet off the ground and four ground radials of 45 foot length the Opek was always 1 to 2 S units better on all HF bands. Surprised the heck out of me as the Opek is a lot lighter weight than the Outbacker! I did not test anything above 10 meters.

The Opek will mount on a standard SO-239 mount and the whip is removable. The only issue with this antenna is the poor whip to coil mechanical connection, as noted on the eHam reviews. I solved that problem with a □Wire Reducer Wire Connector□. Looks funky but it works. They may have improved that in the newer antennas but the in picture it still looks like my older one.

http://www.lowes
com/pd_36042-12704-770143L_4294722554__?productId=3128695&Ntt=ideal&pl=1&curr
ntURL=%3FNtt%3Dideal&facetInfo=

The Opek will be a lot lighter weight than the ATAS, is a lot cheaper, has no moving parts to go wrong, will be a lot less stress on your bike and will

help you keep your balance and controllability by keeping your center of gravity lower.

I really do like the screwdriver antennas when mobile so I don□t have to stop to change bands but on your bike you should be able to change bands by just reaching behind you and moving the □Jumper Lead□. Sounds like a good YouTube video to make while in motion!

Let me know if you have any questions about my experiences with the Opek or biking with antennas.

73,

Charles WA5VHU

Hello Group,

Had a great QSO with Mike, KF3CD/Bicycle Mobile last night whilst I was pedestrian mobile on the beach in Blackpool England.

Here is the video Mike made whilst on the move on the bike:

I'd like to hear about anyone's experience with using bikes in Emcomm exercises or plans. We all know they are used in event support (I.e. Marathons), but I am talking about emergency or disaster response. Seems to me they would be ideal in many scenarios. Organizations like St. John's use bikes a lot for mobile firdt response. I am asking because of an upcoming conference so please respond soon if anyone has any experience or ideas about this.

Barry, I have taught an EmComm class in the past and one of the recommendations that I make is that a bicycle be included as part of the one's disaster kit. That advice applies to both hams and non-hams. However, a bicycle can be invaluable to EmComm efforts. Being on a bike (particularly a mountain bike) provides mobility through and around disaster sites when motorized vehicles are rendered useless. It can also be used to carry supplies if need be.

I have personal experience with using a bicycle in a disaster scenario. In 2005 the small town in which I live was struck by a tornado. Many streets were impassable by car due to debris. Also, within hours of the storm the National Guard sealed off the town and would allow only emergency vehicles into the area. I wanted to check on friends and offer assistance so I hopped on my mountain bike. I was allowed past the checkpoints since I wasn't in a motorized vehicle. The knobby tires on my bike allowed me to ride over small bits of debris without fear of having a flat. When I encountered downed trees or power lines I either detoured around them through yards or other off-road paths or simply picked the bike up and hoisted it over the obstacle. Once on the other side I simply pedaled on my way.

Although in that particular instance I wasn't working in an EmComm capacity I did carry an HT in case it was needed for any reason. However, that experience pointed out that a bicycle can provide speed, on and off-road mobility and the ability to cover relatively large distances like no other vehicle. In situations where one needs to either navigate a disaster area or get away to a safe location without needing fuel or requiring roads to be passable I think a bike is an invaluable tool.

Here in Portland we have an exercise called the Disaster Relief Trails where cargo bikes have to deliver various relief supplies over a course (typically about 30 miles) that include obstacles. Our various county and city Emergency Managers are involved as are ARES groups. There are a couple of mobile hams mixed in with the participants.

2012 DRT
http://transportland.org/2012/04/disaster-relief-trials-overview/

And for 2013 it was expanded to a series including several cities.

From: <sixstatutemiles@...>
Topic: 3095 Message: 3099

I just did comms support for a large scale (est over 2,000 participant) multi-state bike ride event. Majority of route was through remote areas and Amateur Radio turned out to be the primary means of event coordination due to poor to non-existent cell phone coverage.

While my station was fixed I went prepared to support a wide range of communications modes and bands. In preparation for the event I was going through my check list with the event coordinator and indicated that I could take my mountain bike. The response was "don't have a clue of what you will need it for" so I did not take it.

Turns out to have been a major mistake not to take my bike as I wound up having to need it for multiple reasons. If it had been equipped with a 2M radio it would have been a huge asset to assist the medics with response to accidents.

I am now putting together a plan on how to mount any of a number of different radios and antennas on my mountain bike to support future events.

Phil,

I would recommend getting a bicycle trailer just for that purpose and take it with you on your bike. You an either build your own or get on that is already made and readily available at your local bike shop - I have kit trailer that I got from a guy here in Oregon, at http://www.bikerev.com/ he's very reputable and recommended and his prices are reasonable.

If you decide to buy from him, tell him I told you to get a trailer from him. On a side note, I will be updating my kit trailer that I got from him in a couple weeks with a new design.

Jeff,

Great low cost utility trailer! Thanks for the heads up. I have been trying to get my wife to take up biking with me and if I could this would be the perfect way to haul outing supplies with us for day outing rides on some of the converted rail road beds in the area.

Phil, anytime - there is a guy on youtube that has a trailer like that one I pointed out to you last night in my previous email, where he simply just threw his gear in the back of his trailer and went off and I think he had a Bob trailer with a tough box like that one's like those in the BikeRev website.

I will be replacing the box on my kit trailer with a newer box like that but, I'm going to have a friend who is an architect help me design a much newer one so, that I can carry the tripod, antenna and support poles in a dry compartment - the idea behind this is to make it like the LAFD SUV Command vehicles that battalion chief's drive.

Good Luck.

I attended the AGM/conference of the BC Cycling Coalition on the weekend and attended an interesting presentation by Robert Johns, VE7GER. He ran an excercise in Victoria BC using bikes which is documented here: http://www.victoria.ca/EN/main/departments/emergency-preparedness/tour-de-disaster-cyclist-emergency-and-disaster-response-rally.html.

I'd like to hear from anyone interested in documenting this kind of effort, and sure that Robert would as well.

Phil,

I would recommend getting a bicycle trailer just for that purpose and take it with you on your bike. You an either build your own or get on that is already made and readily available at your local bike shop - I have kit trailer that I got from a guy here in Oregon, at http://www.bikerev.com/ http://www.bikerev.com/ he's very reputable and recommended and his prices are reasonable.

If you decide to buy from him, tell him I told you to get a trailer from him. On a side note, I will be updating my kit trailer that I got from him in a couple weeks with a new design.

I just did comms support for a large scale (est over 2,000 participant) multi-state bike ride event. Majority of route was through remote areas and Amateur Radio turned out to be the primary means of event coordination due to poor to non-existent cell phone coverage.

While my station was fixed I went prepared to support a wide range of communications modes and bands. In preparation for the event I was going through my check list with the event coordinator and indicated that I could take my mountain bike. The response was "don't have a clue of what you will need it for" so I did not take it.

Turns out to have been a major mistake not to take my bike as I wound up having to need it for multiple reasons. If it had been equipped with a 2M radio it would have been a huge asset to assist the medics with response to accidents.

I am now putting together a plan on how to mount any of a number of different radios and antennas on my mountain bike to support future events.

There is event here in the United States that is held in Seattle, Wa., Portland, Or., Eugene, Or and I also believe in San Francisco, Ca., called the Disaster Relief Trials, what this does is stimulates the efforts and likes of using Cargo Bike for disaster relief and distribution. We just got done with the Eugene DRT's earlier this month with over 30 participants that participated in the first DRT's to be held in Eugene this year, Portland and Seattle have had their for the past couple of years, I'm told - and, I'm not too sure about the SF, Ca., portion at this point.

But we did use Amateur radio for our communications between checkpoints and kept tracking logistics among the riders involved for the organizers and more.

3106. BMHA 2014 Dayton Forum Speakers wanted

Yahoo group: BMHA
Date: 2013-11-07 15:57:32 UTC
From: <nf0n@...>
Topic: 3106 Message: 3106

It may seem a little early but I am looking for speakers for the 2014 BMHA Forum for the Dayton Hamvention. The perks are a Hamvention pass and a parking space in the Vendor parking area right next to the Arena. The date is May 18, 2014

It you are interested, please contact me a nf0n@arrl.net to discuss.

Thanks,

BMHA Forum Moderator, Mike, NF0N

3107. Antenna Mount for Rear Rack

Yahoo group: BMHA
Date: 2013-12-07 18:54:41 UTC
From: <bpdlists@...>
Topic: 3107 Message: 3107

Currently I have my dual band antenna on an aluminum plate behind the seat, attached to the seat rails using a Minoura bottle cage holder. This setup works well, but the antenna is too close for my liking.

So I am thinking I want to have something off the side of the rear rack, so I can still use a racktop bag, similar to this:
http://www.k5pa.com/Ham% 20Radio/Bicycle%20Mobile.htm
http://www.k5pa.com/Ham%20Radio/Bicycle%20Mobile.htm

Any thoughts on how to mount an aluminum plate to the rack? My challenge is that I have a Blackburn EX-1 rack without a rear platform:
http://www.rei.com/product/ 856419/blackburn-ex-1-bike- rack

Topic: 3107 Message: 3108

For my bike... I went to Home Depot and got 2 pieces of alumunim which were I think 36 inches long... I think 1 or 1 1/2 inches wide... and 1/8 inch thick. I cut each piece in half so I had 4 pieces that were 18 inches long. I then stacked the 4 pieces together so that they would be 1/2 inch thick.

I then went to Boat US (you can go to any boating supply place and maybe other places) and I got some stainless steel pieces that would fit around the "vertical" pieces of the bike rack and sit against the aluminum pieces. I marked where the holes would go on one of the aluminum pieces and then put all 4 pieces together and drilled them all at the same time.

I then had an aluminum angle mount from n old scanner antenna that I drilled out and put a 2 inch SO-239 feedthru connector (I'm sure you can get something similar at HRO or any ham store with either an SN-239 or NMO mount... which ever you desire).

I can take some pictures and e-mail them to you if you want to see how it looks.

I mounted a small rectangular steel piece perpendicular on my aluminum rear rack via hefty ¼ bolts and nuts. I mounted a VHF/UHF antenna on one side with coax connected to the front port of my FT-817 and on the other side I mounted a connector for the Hustler Resonators with a 3 foot mast connected to the rear port, via 817 auto tuner. I have contacted 7 countries and 26 states while riding. I have no problem with the aluminum it is mounted on.

From: Jim Bassett
Topic: 3107 Message: 3112

I use a 19 inch dual band antenna on the back corner of my rear rack at it is attached with a Mirror Mount used by truckers. It is simply a clamp using 2 pieces of metal with two bolts running through it. It is approximately 4 inches long 3/4 inch wide. This is 3/8 24 thread type antenna mount. I sometimes switch out the 19 inch antenna for a 80 inch Hustler 2 meter antenna. The 80 inch I use in areas of high traffic that have a bus route. When I see the bus coming in my mirror I start swinging the antenna left and right and it cause the bus driver to move over an entire lane to pass me. With the 19 inch antenna mounted the bus mirror will pass within inches of my head.

With this mount I can also switch out to an HF Hustler antenna. My HF Hustler mast is the short 20 inch variety. Then I can put the desired resonator on top. I do not use a spring on the bottom for the HF mast.

All my radios are placed in a handle bar bag. This has proved safer for me and the radio. I've crashed and the radio was untouched. Wish I had fared that well. LOL!!!

That's my 2 cents worth. Good Luck!

3116. distance between antennas...

Yahoo group: BMHA
Date: 2014-02-13 12:57:32 UTC
From: n1evh@verizon.net
Topic: 3116 Message: 3116

Right now on my mountain bike... I have a rack on the back of my bike.
On the rack... I've got a piece of aluminum about 18 inches long. At the
end of the aluminum I have an Opek HV-100 antenna which is good for
6m, 2m, 70cm, and HF (10m, 15m, 2m0, 40m... depending on which
HF coil I have on the antenna.

I recently picked up a used Yaesu ATAS-25 manually tuned screwdriver
antenna that I want to try on HF. Now according to the manual for this
antenna... there are 3 elements that get attached to the top of the antenna.
It says to use 1 or 2 for 10m... 2 for 15m... 2 or 3 for 20m... and 3 for
40m.
The antenna can also be used on VHF/UHF with none of these elements
on the antenna.

Now switching from HF to VHF with this antenna would be a pain in the
butt if i have to stop to remove elements... or add elements if I want to
go
from VHF to HF. I do have a Comet 6m, 2m, 70cm mobile antenna that I
could also use (since the FT-817 has 2 antenna jacks.

Has anyone tried setting up both VHF/UHF and HF antennas on a bike
at the same time??? If so... should the two antennas be kept a certain
distance from each other???

I know when it comes to antennas on a bike... all antenna theory is pretty
much thrown out the window (ie: not using any radials/counterpoise like
you would usually need with a HF portable/mobile antenna). So I didn't
know if I should keep the 2 antennas apart from each other or not.

Thanks,
Mike - N1EVH

From: n1evh@verizon.net
Topic: 3115 Message: 3117

I don't know if there are any recommended BMHA frequencies for bike and/or pedestrian operations... but the HFpack group has a list of frequencies for each band which they say can be used by those that are base, mobile, portable, QRP, QRO...

http://hfpack.com/air/

I've never tried checking in on any of these frequencies when I'm out on my bike. I pretty much just tune the entire band... and try to work whoever I hear... stateside or DX.

I tend to stick around the HF Pack frequencies found on hfpack.com. These are the guys that have their HF rigs in their backpacks. They welcome mobiles and they tend to listen pretty well.
I usually start on these:
14342.5 kHz USB
14346.0 kHz USB
18157.5 kHz USB
18117.5 kHz USB

I HAVE BOTH A vhf/Uhf and Hf Antenna mounted on my rear bike rack. There is only about 2 feet separating them and both appear to work fine. I carry the 817 tuner on top of my 817 and HF tunes great and I hit most repeaters I hear with no problems. I have worked 6 countries and 23 states with this configuration. Take a look at pictures on QRZ website under my call to see pictures.

Hope this helps

Hmmmm... looking at the pics on qrz.com... don't know if its the angle in which the picture was taken at but... your two antennas don't look like they are 2 feet apart.

I was thinking about changing my 18 inch piece of aluminum to a 24 inch piece... and then getting perhaps 1 foot spacing between the two antennas. I would put the ATAS-25 antenna at the end of the piece of aluminum and put the Diamond CR627B antenna about 1 foot away.

Since the ATAS-25 is a manually turned screwdriver... then I "shouldn't" need a tuner. Right now I'm not using a tuner with my FT-817 and the Opek HVU-100

Still got some time to think about things... got who knows how much snow on the ground and getting even more right now.

I HAVE BOTH A vhf/Uhf and Hf Antenna mounted on my rear bike rack. There is only about 2 feet separating them and both appear to work fine. I carry the 817 tuner on top of my 817 and HF tunes great and I hit most repeaters I hear with no problems. I have worked 6 countries and 23 states with this configuration. Take a look at pictures on QRZ website under my call to see pictures.

Hope this helps

Subject: [BMHA] distance between antennas...

Right now on my mountain bike... I have a rack on the back of my bike. On the rack... I've got a piece of aluminum about 18 inches long. At the end of the aluminum I have an Opek HV-100 antenna which is good for 6m, 2m, 70cm, and HF (10m, 15m, 2m0, 40m... depending on which HF coil I have on the antenna.

I recently picked up a used Yaesu ATAS-25 manually tuned screwdriver antenna that I want to try on HF. Now according to the manual for this antenna... there are 3 elements that get attached to the top of the antenna. It says to use 1 or 2 for 10m... 2 for 15m... 2 or 3 for 20m... and 3 for 40m.
The antenna can also be used on VHF/UHF with none of these elements on the antenna.

Now switching from HF to VHF with this antenna would be a pain in the butt if i have to stop to remove elements... or add elements if I want to go
from VHF to HF. I do have a Comet 6m, 2m, 70cm mobile antenna that I could also use (since the FT-817 has 2 antenna jacks.

Has anyone tried setting up both VHF/UHF and HF antennas on a bike at the same time??? If so... should the two antennas be kept a certain distance from each other???

I know when it comes to antennas on a bike... all antenna theory is pretty much thrown out the window (ie: not using any radials/counterpoise like you would usually need with a HF portable/mobile antenna). So I didn't know if I should keep the 2 antennas apart from each other or not.

Thanks,
Mike - N1EVH

Hi Mike,
You were in or near the blizzard warning area last time I looked. The Cape is probably getting hammered. Our show ended a while ago along the Conn. coast in Guilford. It'll be a while before I can drag my bike out here too. Might be a while before I can get the car out for that matter, unless my plow guy comes out of hiding at some point. Might need dynamite to blast the glaciers at the driveway entrance, formed from the town plows, if he waits too long!
Might get up to your area for a day or two this summer. I'd be at Boxboro too if ARRL hadn't screwed things up.

Best,
Sonny N1KHB

In a message dated 2/15/2014 10:15:45 P.M. Eastern Standard Time, n1evh@... writes:

Hmmmm... looking at the pics on qrz.com... don't know if its the angle in which the picture was taken at but... your two antennas don't look like they are 2 feet apart.

I was thinking about changing my 18 inch piece of aluminum to a 24 inch piece... and then getting perhaps 1 foot spacing between the two antennas. I would put the ATAS-25 antenna at the end of the piece of aluminum and put the Diamond CR627B antenna about 1 foot away.

Since the ATAS-25 is a manually turned screwdriver... then I "shouldn't" need a tuner. Right now I'm not using a tuner with my FT-817 and the Opek HVU-100

Still got some time to think about things... got who knows how much snow on the ground and getting even more right now.

Does someone have a yellow cycling jersey which says "EVENT OFFICIAL" or something similar? If so, do you know of a source for such a jersey? If not, I'd probably go Voler semi-custom or similar.

I don't know who many events you support however here is what I have found from our local event organizers.

I provide bicycle mobile communications in local events, such as Susan G. Komen Race for the Cure, Diabetes Run, various marathon non-bicycle and MS 150 Bike public service support roles. For these events most of the event organizer want us to wear their event T-shirts along with us wearing some type of Radio Communications Vest. In the bicycle events organizers we support they do NOT want us to wear cycling jerseys as it does not allow other officials to rapidly find us when we blend in with the competing cyclist.

Hope your events go off without a hitch

Interesting point. In my area the charity ride season is April and October, with a bunch of diabetes, MS, and other rides split between the weekends in those months. Even at those times of year, riding with a T-shirt with a vest on top can be HOT! Even the official vest on top of a yellow cycling jersey is hot. There are cooler vests than the "official" one, but since that requires deviating from the standard issue radio/SAG vest, might as well look into a jersey that looks similar.

The event volunteers will wear the event T-shirts, but they don't ask of that for those of us who are moving around on the course - the radio (motorcycle/bicycle) and SAG support - I believe in part because we are all pretty identifiable already through our radio equipment. I've already brought up the jersey question to the head of the radio/SAG support group, and they don't foresee any issues with a custom cycling jersey which looks official.

The BP MS150 in Texas has jerseys for both their bicycle-mobile volunteers. The medics and "Officials" each have distinctive jerseys and the motorcycle marshals wear distinctive matching vests over their protective clothing.
They have 13,000 bicyclists and 70-90 motorcyclists on the road from Houston to Austin every year.

I'm happy to report that I recently worked Antarctica from my bike to complete a Bicycle Mobile WAC. We have had an unusually brutal winter here in southeastern PA, with snow once or twice a week, every week for the past 3 months solid but I have braved the cold on occasion to ride and have managed to work a few new ones from the bike this winter. I'm now at 152 DXCC entities worked from my bike, with 120 of them confirmed, since I started this little obsession in 2010. I thought I'd never get Antarctica but recently saw RI1ANR on the DX Cluster on 17 meters and for once, I could hear him very well...BUT he was operating CW. Most all of my bicycle mobile contacts are in SSB but I had to try to work him, one way or another...so I plugged in my mini "Paddlette" key and worked him on the first or second call. Doesn't matter how you work 'em, as long as your work 'em!

WOW... Congrats. I've never even heard Antarctica from home... never mind on bike.

Unlike you... here in Boston... my bike has been put away for the winter. In the next week or two... I will be making a few changes to my setup on my bike. I'm going to make some minor changes to how I power my FT-817 on my bike and trying a new/different antenna.(going to give a Yaesu ATAS-25 a try... see if its any better than my Opek HVU-100). I'll use my Diamond CR627B antenna for 6m/2m/70cm... and just use the ATAS-25 on HF (so... 2 antenna mounts... since the FT-817 has 2 antenna jacks).

I tried a hamstick once... but I thought it was way to big (tall) on my bike

However... when it comes to compromise antennas on a bike... I'm sure the longer it is... the better it will perform).

Doesn't your 817 use the HF input for 6 meters not the VHF/UHF input? I
believe that's what my FT-857 does.

Yeah.. the FT-857 (and FT-897) does... but with the FT-817... you can
select which antenna jack you want use on each band.

So... since I'll have 1 antenna for HF and one antenna for VHF/UHF... I'll
setup the FT-817 to send 10m thru 40m to the read antenna jack and
have it send 6m thru 70cm to the front antenna jack.

3139. RE: [BMHA] Bicycle Mobile WAC.Changed to 817 Question

Yahoo group: BMHA
Date: 2014-03-07 01:01:24 UTC
From: William Brandhorst
Topic: 3131 Message: 3139

My FT-817 is mounted on my bicycle and that is exactly how I do it. No antenna switch required and my Z817 tuner is on the rear jack.

Bill - K5WDB

Subject: Re: [BMHA] Bicycle Mobile WAC.Changed to 817 Question

Yeah.. the FT-857 (and FT-897) does... but with the FT-817... you can

select which antenna jack you want use on each band.

So... since I'll have 1 antenna for HF and one antenna for VHF/UHF... I'll

setup the FT-817 to send 10m thru 40m to the read antenna jack and

have it send 6m thru 70cm to the front antenna jack.

Doesn't your 817 use the HF input for 6 meters not the VHF/UHF input? I

believe that's what my FT-857 does.

3140. VX8-DR mounting and antenna

Yahoo group: BMHA
Date: 2014-03-15 21:38:51 UTC
From: <kc6ete@...>
Topic: 3140 Message: 3140

I finally got back on two wheels again, with a Diamondback insight 2. Changed jobs, and now I have a four mile commute with sidewalks (legal here) and some bike paths.

I have a handlebar mount and HT sled from RAM, but I'm not thrilled with either the big heavy original duck or the thin whip I have, which would be like a psycho cat toy in face-poking range.

Ideally, I would be thinking in terms of an SMA cable to an antenna on a back rack. No rack yet.
I only plan to operate 2 and 440, but other options would be a plus.

Suggestions on antenna and rack?

3141. Re: [BMHA] VX8-DR mounting and antenna

1/2 wave antenna to eliminate grounding issues, cheapest rack you can find that will hold pannier bags.

Topic: 3140 Message: 3142

I've looked at a bunch of mobile antennas, thinking on a 1/4 wave vertical (springy cat-toy whip) with a descending counterpoise from that point. There are so many issues with mounting things on bicycles, shock and vibration, and resonances that I want to keep each element as small and "dead" as possible.

3143. Re: VX8-DR mounting and antenna

I use the VX8-GR with a half wave on the back of the rack. Have had good success using it on many rides including working bike mobile SAG at the Hilly Hundred.

I have a Tram 1180 dual band antenna attached to the rear carrier of the bike. it's 1/2 wave for 2m, and stacked 5/8s on 440, so not much of a ground plane is needed.
There are some photos of the setup here:
https://www.flickr.com/photos/76937082@N00/sets/72157623814719986/
https://www.flickr.com/photos/76937082@N00/sets/72157623814719986/
I've made a few changes since those photos were taken, but most of them are hidden. I've replaced the lead-acid battery with a Li-Po setup, and moved both the battery and the APRS puck GPS into the handlebar bag.

Reviews of the antenna can be found here: http://www.eham.net/reviews/detail/1920

3145. TCFMC Next general meeting and presentation - March 24th - tonight!!

Yahoo group: BMHA
Date: 2014-03-24 15:25:34 UTC
From: S. Earl Jarosh
Topic: 3131 Message: 3145

If any of you happen to live in the Twin Cities area of MN you are welcome to come and check out our meeting tonight. I would love to have you as a club member. I hope to do a club presentation on my bicycle trip around Lake Superior in the near future.

LOTW - Logbook of The World. Yes, you have heard of it. Many you use it but many more of you do not! With only 65000 registered users, change is hard for hams. Join the TCFMC and Al Dewey, K0AD, as he gets you started, gives you the hints and kinks for successful use, and discusses some of the recent issues and fixes that ARRL has implemented. We will also have some other exciting announcements at the meeting so be there.

TCFMC meeting will be held in a new venue at the West Medicine Lake Community Club at 1705 Forestview Ln North in Plymouth.

From Hwy 55 take West Medicine Lake Drive north to 18th Ave (at the only stop sign) take a left (west) for 2 blocks to Forestview Ln n. take Left (south) follow to parking lot. Talk-in on 146.76 with call W0EF. Map on the website.

That's TCFMC at the West Medicine Lake Community Club in Plymouth on March 24th, 7 PM!

See you there!!!

Hello Earl,

I do live in the Twin Cities area (NE Minneapolis) and have a Ham Radio equipped HPV (Recumbent, "Tadpole" trike, I.C.E. Adventure). So I am very interested in bicycle mobile ham radio operations.

I am a member of the TCFMC and am the Vice President of the TCRC.

I look forward to your presentation on bicycling around Lake Supeirior.

73,

Dave - KE0NA

3148. BMHA Forum Dayton Hamvention Details-May 18, 2014

Yahoo group: BMHA
Date: 2014-04-21 00:42:56 UTC
From: <nf0n@...>
Topic: 3148 Message: 3148

We are all set for the forum at the Dayton Hamvention. We once again have two of the best forum speakers and I think you will enjoy attending once again. Over the years we have had great topics that interest all and this year is no exception. Here are the details as they will appear in the Hamvention program:

Sunday May 18, 2014 09:15 - 11:15

Bicycle Mobile Hams of America (The 24th Annual BMHA forum at Hamvention)

Moderator: Mike Nickolaus, NF0N

Bicycle Mobile Hams of America got its start in1989 when a QST article by Hartley Alley, NA0A asked hams who operate their radios while bicycle-mobile to get together and form a group. BMHA hosts a website along with the BMHA Yahoo Groups forum.

WA4DXP – M. D Smith – Program with detailed illustrated photos showing the most simple of bike mobile setups, a HT in a small camera bag with a rubber duck and speaker mic to the full blown HF-VHF-UHF, 100 watt amp. M. D. will have his bicycle on display along with his special QSL card.
KA9RSL – Keith – Keith will detail Ham support for the “Hilly Hundred” annual ride that was started by Hartley, NA0A. Keith uses APRS for tracking and will show pictures about the Ham support. He will have on display his bicycle and support trailer.

We plan to have bicycle mobile displays and demonstrations of each will be conducted.

Date: 2014-04-27 22:35:17 UTC
From: <vhuntertdi@...>
Topic: 3150 Message: 3151

Hi Cliff, and all the others who maybe interested...

Yes, we WILL have a ride this year. I just sent a note to the BMHA web master asking to have info put
on the BMHA-HAMS web site. Its the same info as last year, except that the date is Saturday the 17th
this year.

Sorry for the delays. I have been a bit bummed lately after surgery in January on the bottom
of my foot. Mike - NF0N has said that he would do the ride if at the time I am not feeling up to it.

So it will be either Mike or myself this year on the ride, depending on how my foot is treating me.. I hope that its feeling good by then.

Unless there is bad weather nearby, we should be on the trail around 2PM. Mike and I
will be there by 1:30, and maybe a little earlier. Last year we stopped by Subway
on the way to the park and brought our lunch to eat at the picnic table and that worked well for us.
Others who want to do lunch in the park are welcome to bring their lunch and eat with us.

I will have a radio on 146.55 (five five) simplex for talk in once you get near the park like last year.

I hope to see everyone from last year, and some new friends too!

73 - Arnie KA0NCR

3152. Re: hamvention bicycle ride it is ON!

From: Keith Miller
Topic: 3150 Message: 3152

I plan to bring some snacks again like I have the last few years. I will be in Dayton on Thursday if anyone wants to ride with me. Plan to ride the paths north of Dayton from the Tipp City area.

Keith, KA9RSL

3153. Hamvention bicycle ride - 2014

Yahoo group: BMHA
Date: 2014-05-01 18:42:33 UTC
From: <vhuntertdi@...>
Topic: 3153 Message: 3153

Hi Group,

I just wanted to post again, in case some might have missed it, that we are going

to be doing the BMHA ride again on Saturday the 17th.

For complete details, see the bmha-hams.org web site - a direct link to which is here.

http://www.bmha-hams.org/timely/Dayton2014.htm
http://www.bmha-hams.org/timely/Dayton2014.htm

I hope that everyone who is interested will come out for the ride.. I have put
in a request for good-dry-warm weather on that day. I hope it comes through!

73 - Arnie KA0NCR

Will bump this again for any who have missed it. I will be there.
Also on Thursday afternoon I will be riding the trail north of Dayton.
Will start on the east side of Vandalia off US40 and plan to ride north
to Tipp City and Troy.
Join me if you want to go along. It is a nice ride along the old canal
and river.
Starting here.
532 S Cassel Tipp City, OH 45371

3155. ATAS-25 on mountain bike...

Yahoo group: BMHA
Date: 2014-05-07 20:44:49 UTC
From: n1evh@verizon.net
Topic: 3155 Message: 3155

Well... now that the warmer weather is returning to the Northeast USA, I finally got a chance to spend some installing a mount on my mountain bike so I can use both my ATAS-25 antenna and my Diamond CR627 (6m, 2m, 70cm) antenna. Yeah... I know the ATAS-25 "should" do 6m, 2m, and 60cm... but I'm sure the Diamond antenna will work better on those bands.

When setting up the antenna... I used my MFJ-269 antenna analyzer to find a good SWR on each band... and then I connected my FT-817 to make sure it was happy with the SWR.

Now I was able to get a good SWR on 40m, 30m, and 20m with all 3 of the radiating elements on the antenna (the coil almost all the way up for 40m... near the middle for 30m... and near the bottom for 20m). When I took off one of the radiating elements to try to tune other bands... I was
also able to get a good SWR on 20m with the coil a little bit higher.. as well as get a good SWR on 17m, 15m, 12m, and 10m all with 2 of the radiating elements with the coil near the bottom.

When I connected my FT-817 to the antenna and checked the SWR on various bands... the radio's built-in SWR meter was showing NO bars on every band... with the exception of 10m (since that band is almost 2 MHz in size). I know an external SWR wold be better... but I figured if the internal SWR meter shows nothing... then the radio should be happy with the SWR.

Unfortunately... as I tune around the bands... every HF band seems to be DEAD today. I would like to compare the antenna on 20m with just 2 and with all 3 of the radiating elements and the coil at different positions

II ordered some plastic clamps on eBay... as it looks like it wouldn't take much in way of bumps... for the coil on the ATAS-25 to work its way down the antenna. I'll use a plastic clamp to keep this from happening (I don't think I have to worry about the coil working its way up the antenna).

Hi Mike,
I'm curious as to what sort of plastic clamps you ordered. I don't have an ATAS, but I still like to make mental notes of available hardware pieces for future use somewhere. Anything special about the mounts?
Good luck with the installation.

Best,
Sonny N1KHB

3157. Re: [BMHA] ATAS-25 on mountain bike...

Yahoo group: BMHA
Date: 2014-05-07 23:00:21 UTC
From: n1evh@verizon.net
Topic: 3155 Message: 3157

I bought these...

http://www.ebay.com/itm/331142687647?ssPageName=STRK:MEWAX:IT&_trksid=p3984
m1423.l2649

I've seen some places selling a package of 10 for like $5 or $6 with
$1 or $2 for shipping... which is the opposite of what I pained (which
was $1.50 for the clamps and $5 for shipping).

These have a clamping diameter of .569" to .650"... and I measured
the piece of the ATAS-25 that it has to go around at .590". This should
keep the ATAS-25's coil from sliding down when hitting small bumps
and so on.

The ATAS-25 has a 1/4-20 threaded hole on the bottom of the antenna
for mounting. So I found a right-angle NMO mount. I then bought an
adaptor on eBay which was 3/8-20 one one side and 1/4-20 on the
other side. I then went to Lowes and bought a 3/8-20 nut that had
something on it so it would lock into place (so I wouldn't have to use
a thick lock-washer... and it wasn't a nylon insert).

I used 4 pieces of 1" x 1/8" x 36" aluminum (cut down to 30") to make
the mount to go on my bike rack to mount the two antennas. There is
a bit of side-to-side sway. A friend of mine that works in a machine
show is getting me a piece of 1" x 1/2" x 30" aluminum. This should
greatly reduce or eliminate the side-to-side sway in the mount from
having 2 antennas on it.

When I first tried to play around with this (I think late Feb or early March
notice a 1/2 to 1 S-unit increas on receive (I had the ATAS-25 and my
Opek HVU-100 on my bike at the same time so it was easy to switch
between the two very quick). However... it was a bit cool back then to
really play around with setting up the antenna.

I'm glad I finally got the antenna setup AND it gives me a flatter SWR
across the band than my Opek HVU-100... as I just upgraded to Extra
about a month ago... so now I have more of the bands to play on :-)

Mike - N1EVH

Well... now that the warmer weather is returning to the Northeast USA, I finally got a chance to spend some installing a mount on my mountain bike so I can use both my ATAS-25 antenna and my Diamond CR627 (6m, 2m, 70cm) antenna. Yeah... I know the ATAS-25 "should" do 6m, 2m, and 60cm... but I'm sure the Diamond antenna will work better on those bands.

When setting up the antenna... I used my MFJ-269 antenna analyzer to find a good SWR on each band... and then I connected my FT-817 to make sure it was happy with the SWR.

Now I was able to get a good SWR on 40m, 30m, and 20m with all 3 of the radiating elements on the antenna (the coil almost all the way up for 40m... near the middle for 30m... and near the bottom for 20m). When I took off one of the radiating elements to try to tune other bands... I was
also able to get a good SWR on 20m with the coil a little bit higher.. as well as get a good SWR on 17m, 15m, 12m, and 10m all with 2 of the radiating elements with the coil near the bottom.

When I connected my FT-817 to the antenna and checked the SWR on various bands... the radio's built-in SWR meter was showing NO bars on every band... with the exception of 10m (since that band is almost 2 MHz in size). I know an external SWR wold be better... but I figured if the internal SWR meter shows nothing... then the radio should be happy with the SWR.

Unfortunately... as I tune around the bands... every HF band seems to be DEAD today. I would like to compare the antenna on 20m with just 2 and with all 3 of the radiating elements and the coil at different positions

II ordered some plastic clamps on eBay... as it looks like it wouldn't take much in way of bumps... for the coil on the ATAS-25 to work its way down the antenna. I'll use a plastic clamp to keep this from happening (I don't think I have to worry about the coil working its way up the antenna).

Oh yes, I know those. My spouse KB1EBF got me an assortment of them a while back. The original use for them as I know it are as hose clamps. They tighten in discreet steps just so you know.

Best,
Sonny N1KHB

I bought these...

http://www.ebay.com/itm/331142687647?ssPageName=STRK:MEWAX:IT&_trksid=p3984.m1423.l2649

I've seen some places selling a package of 10 for like $5 or $6 with $1 or $2 for shipping... which is the opposite of what I pained (which was $1.50 for the clamps and $5 for shipping).

These have a clamping diameter of .569" to .650"... and I measured the piece of the ATAS-25 that it has to go around at .590". This should keep the ATAS-25's coil from sliding down when hitting small bumps and so on.

The ATAS-25 has a 1/4-20 threaded hole on the bottom of the antenna for mounting. So I found a right-angle NMO mount. I then bought an adaptor on eBay which was 3/8-20 one one side and 1/4-20 on the other side. I then went to Lowes and bought a 3/8-20 nut that had something on it so it would lock into place (so I wouldn't have to use a thick lock-washer... and it wasn't a nylon insert).

I used 4 pieces of 1" x 1/8" x 36" aluminum (cut down to 30") to make the mount to go on my bike rack to mount the two antennas. There is a bit of side-to-side sway. A friend of mine that works in a machine show is getting me a piece of 1" x 1/2" x 30" aluminum. This should greatly reduce or eliminate the side-to-side sway in the mount from having 2 antennas on it.

When I first tried to play around with this (I think late Feb or early March
notice a 1/2 to 1 S-unit increas on receive (I had the ATAS-25 and my Opek HVU-100 on my bike at the same time so it was easy to switch between the two very quick). However... it was a bit cool back then to really play around with setting up the antenna.

I'm glad I finally got the antenna setup AND it gives me a flatter SWR across the band than my Opek HVU-100... as I just upgraded to Extra

about a month ago... so now I have more of the bands to play on :-)

Hi Mike,
I'm curious as to what sort of plastic clamps you ordered. I don't have an ATAS, but I still like to make mental notes of available hardware pieces for future use somewhere. Anything special about the mounts? Good luck with the installation.

Yeah... I was looking for a plastic hose clamp (similar to the metal ones that you see and use)... but I couldn't find anything like that.. So... I bought some of these clamps.

About the only place where I've seen a hose clamp like this... is on the tail light for my bike. (so it will tighten around the seat post or the frame that the seat post goes into).

And yeah... I see the teeth to indicate that they adjust is steps. If it doesn't tighten around the ATAS-25... then I have some thin pieces of rubber that I can put around the antenna... and then tighten this clamp over it.

3170. Bicycle Mobile DXCC, WAC and WAS done!

Yahoo group: BMHA
Date: 2014-08-08 16:35:44 UTC
From: kf3cd@...
Topic: 3170 Message: 3170

This discussion group seems to have been pretty quiet lately so i thought I'd post this update on my bicycle mobile activities and maybe stir up some activity.

Last year I completed DXCC from my bike, I'm now at 156 and new ones are getting pretty hard to work. Earlier this year, I finally worked Antarctica for WAC from my bike. I worked Antarctica twice, RI1ANR on CW and KC4AAA on SSB...that was a thrill, I never thought I'd get Antarctica from my bike. Although it was dark out and I was juggling mic and iPhone, I managed to take a short video of the QSO with KC4AAA and put it on youtube. Had the op at KC4AAA not paused to ask for mobile stations, i never would have made that contact. You have to laugh at the guy on the video that says "YEAH RIGHT!" when he hears that I am bicycle mobile! Here's the proof pal!

KF3CD/Bicycle Mobile QSO with Antarctica KC4AAA http://youtu.be/zolOyq3EzL4

http://youtu.be/zolOyq3EzL4

KF3CD/Bicycle Mobile QSO with Antarctica KC4AAA http://youtu.be/zolOyq3EzL4 Bicycle Mobile QSO from West Chester, PA. On April 17 at 00:00 UTC with KC4AAA at the Amundsen-Scott South Pole Station. It's not a very good video, ...

View on youtu.be http://youtu.be/zolOyq3EzL4
Preview by Yahoo

Last night I worked Montana, my final state for bicycle mobile WAS. Most all contacts were made at 35 watts, none higher than 50 w, all with hamstick antennas, a Yaesu FT-100 and 7 AH gel cell for power. Wonder if anyone else has completed all 3 from a bike?

73 and happy biking and hamming!
Mike, KF3CD
West Chester, Pa.

Good news, we have been approved for a Forum at the Dayton Hamvention 2015. Our forum will be in Room 5 on Sunday May 17, 2015 from 9:15 - 11:15 AM.

Room 5 is large so bring your bicycles and displays. There are no other forums in Room 5 so we have it nearly all morning.

We have an excellent program already that I am sure you will enjoy. If anyone has a topic they would like to present, let me know and we will add to the program schedule.

Plans are forming for the annual BMHA bicycle ride, more to follow.

Hope to meet all of you at the BMHA Forum in May.

Bicycle Mobile Hams of America (The 25th Annual BMHA forum at Hamvention)

Moderator: Mike Nickolaus, NF0N

Bicycle Mobile Hams of America got its start in1989 when a QST article by Hartley Alley, NA0A asked hams who operate their radios while bicycle-mobile to get together and form a group. BMHA hosts a website along with the BMHA Yahoo Groups forum.

W3FF – Budd Drummond – “The Making of the DX Tricycle, power and Custom Antenna”
NF0N – Mike Nickolaus - “The Best of Bicycle Mobile Hams of America, From 1990 – 2015”
KA0NCR – Arn Grubbs – 25 Years of the Dayton BMHA Ride !

We plan to have bicycle mobile displays and demonstrations of each will be conducted.

3180. Dayton Hamvention BMHA bike ride 2015

Yahoo group: BMHA
Date: 2015-04-18 18:09:08 UTC
From: vhuntertdi@...
Topic: 3180 Message: 3180

Hi Group,

I just wanted to post again, in case some might have missed it, that we are going

to be doing the BMHA ride again on Saturday the 16th.

The specifics should be the same as our rides the past couple of years other than
the actual date.

We plan to meet up in Eastwood park near the trail spur into the park about 1:30 and
be on the trail at 2PM barring dangerous weather..

For complete details, see the bmha-hams.org web site - I hope to
get the info posted there shortly..

I hope that everyone who is interested will come out for the ride.. I have put
in a request for good-dry-warm weather on that day. I hope it comes through!
I will be there along with Mike, NF0N , I hope to see a nice group come out again this
year!

We will be at the park rain or shine, although if bad weather is in the area we
we may hold the gathering under a park shelter to wait it out and decide if it
is prudent to go out on the trail.

73 - Arnie KA0NCR

3181. Bike tools

Topic: 3181 Message: 3181

Hi all,
I've been considering portable bike tool sets such as:

Bike Bicycle Repair Tools Kit Mountain Road Bike Simple Self Repair Tool Set | eBay (http://www.ebay.com/itm/Bike-Bicycle-Repair-Tools-Kit-Mountain-Road-Bike-Simple-self-Repair-Tool-Set-/141454662786?pt=LH_DefaultDomain_0&hash=item20ef5adc82)

New Set of Bicycle Bike Cycling Repair Tools Kit with Pump Box Black Bag | eBay (http://www.ebay.com/itm/New-Set-of-Bicycle-Bike-Cycling-Repair-Tools-Kit-with-Pump-Box-Black-Bag-/311285396014?pt=LH_DefaultDomain_0&hash=item487a0e322e)

New Tab (http://www.ebay.com/itm/Cycling-Bicycle-Bike-Repair-Tools-Kit-Set-with-Pump-Box-Bag-Sahoo-Black-/291465562322?pt=LH_DefaultDomain_0&hash=item43dcb388d2)

Bike Cycling Tyre Repair Tools Kits Set Multifunctional with Mini Portable Pump | eBay (http://www.ebay.com/itm/Bike-Cycling-Tyre-Repair-Tools-Kits-Set-Multifunctional-with-Mini-Portable-Pump-/111660439435?pt=LH_DefaultDomain_0&hash=item19ff7b178b)

Any thoughts or recommendations? Thanks!

Best,
Sonny N1KHB

Some might disagree, but I think those sets look cumbersome and heavy! I carry a Park combination tool (Park tools were standard in the shop where I worked), that will handle many tasks. I also carry a Park chain breaker on long ride WITH a spare snap (emergency) link appropriate for my chain. Patches and 2 tire levers; for a pump I carry a frame pump on my touring bike, it gives me the higher pressure I need, BUT, if you ride a mountain bike, you'll need volume not pressure. I don't carry a tire boot because I always wrap my talced spare tube in a section of tyvek postal envelope in a plastic sandwich bag. For my XYL's bike I add a Park 15mm wrench for adjusting her Pauls' brand brakes. Roadside repairs suck, so annual maintenance is first level preventative. Everything fits nicely into my Acorn saddle bag with room for my wallet and a couple energy bars, etc.Hard core friends carry even less than me, a Co2 inflator, spare tube and a chain link.bobke7hzb

Yeah, preventive maintenance. Extra spokes, chain whip, adjustable wrench,

and the nut for your bike's cassette / freewheel remover. Chain Lube

Multitools, one will not do for some things, you need two of the same tools for several things. Park cumbersome, but some like old crank brothers I bought on tour has a chain tool, strong and small.

3rd and 4th hand tools helpful.

Spare tire. Tube and patch kit, likely to pinch, can give a kit to a stranded biker, time v. money.

Unless doing event or sag support for others, or just like tools, don't need much. Plan route know where shops and coops are, make friends with residents with garages open, water faucets, church key/ magic Corp faucet tools, leave a quarter and a card in a ziploc bag or sinething.

Ratio of heavy tools to causing breakdowns not really learned.

Bough spin doctor beginner tool set back in the day but too heavy to carry to clinics with tools on site. Addicted to 3 way you tools. Park longer than sun , etc cheaper ones. Some Y don't fit well/ unusable with some brakes cheap L hex/ Allen wrench set or useful sizes helpful. Muscle memory of park L hex with endz too.

Phone a friend option too. AAA does bike sag? Or similar now, afaict.

As far as tools, I keep a spare tube and fold up tire in my saddle bag with a pair of tire levers, and a 20g CO2 cartridge to fill it. Also some fix it sticks to handle adjustments. I don't carry a chain tool, because I figure if I damaged my chain that bad,, I've probably got more problems than are reasonable to fix on the side of the road.

Topic: 3181 Message: 3185

I agree with many of the other comments you received and I emphasize the following:

- Depending on where you'll be riding determines the your tool needs.
- Around the block ... don't worry and walk it home.
- Out in the boonies or on a long tour... be self sufficient and carry more tools.

- There is one kind of rider... those who will have a flat.
-Carry a patch kit (I like Slime (larger and last longer than the thin ones) and can get from Walmart). I prefer peal and stick. They are easy to use and I have seen the tubes of adhesive solidify making that style patch useless.
-Carry tire irons (I have three and sometimes I use two and others I use three).
-Carry a good pump. I like frame pumps... there are some that are like a stand up floor pump which a lot easier to use.
- Get a frame pump strap/retainer to keep it from being jarred or knocked off while riding.
- The little pumps are hard to use, especially if you need a lot of volume or need high pressure. (you'll be exhausted when done)
- I used a CO2 inflator once and didn't like it. Might be good if you were racing and time was critical. Otherwise, hand pumps are better.
- Carry a pressure gauge with the correct fitting for your valve and PSI range suitable for your tires. I like the round ones with a locking indicator.
- Carry a spare tube

BTW ... the best flat tire prevention is to check the air pressure before every ride. Especially for low volume high pressure tires. Snakebite flats are most often caused by low tire pressure. Keep a floor pump with integrated pressure gauge ($25 Target, Walmart) in the garage for this purpose (the floor pump is a lot easier to use than the frame pump). Don't use a compressor ... or use with caution since they easily blow a tire.

- There are a limited number of tool sizes on your bike. You can pack a small set designed to your needs. The multitool kits are nice, convenient, helpful if you ride with others and you'll be doing repairs ... but a bit heavier. I ride with an older Bell multitool and of the 20 or so tools, I mostly use a couple Alan wrenches (for adjusting the seat).

- Pack
- Zip ties (I fixed a pedal that fell apart on a scout ride with zip ties)

- Cheap ($1/pr) cotton jersey gloves (For when you need to do chain repair or to put the chain back on)
- Rag, spare tube, some duck or Gorilla tape
- Spare spoke & spoke tool .... only if you know how to tune a wheel
- Spare tube (needs to be sized to the tire and the correct valve type (Shrader or Presta) for your rim). I love Presta and hate Schrader
- I think a small chain tool is a good idea ... but after riding for many years, 3,000 miles per year I have never needed one.
- A small (3"ish) multitool may be nice for the pliers ... to pull stuff (cables or items puncturing the tire)

- I always ride with my wallet (cash, credit card and personal ID) and a cell phone. When I hit a utility knife blade that slit the rear tire crosswise (ruined it) the repair process included a call for a ride home :-) A HT or an 817 may be better for more remote areas.

I don't pack a spare tire. But you need to know how to use duct tape or a dollar bill to temp repair a cut tire.

- Pack these in an under seat pouch or a rear rack bag. A separate tool bag may or may not be appropriate.

As far as the kits listed ...
- I'd likely not use the pump included and I'd buy a frame pump that can be used floor pump style
- The bag may be a bit too much so that may go as well.
- I'd replace the patches with peal & stick style
- Of the 4 listed, this may be the most usable: http://www.ebay.com/itm/Cycling-Bicycle-Bike-Repair-Tools-Kit-Set-with-Pump-Box-Bag-Sahoo-Black-/291465562322?pt=LH_DefaultDomain_0&hash=item43dcb388d2

ALSO, but a Park chain cleaning tool and clean and lube your bike chain. I like dry lube (less leg mess when you bump the chain). If it isn't shifting perfect and crisp, then it may need cleaning & lube (can lube only if in the road).

Now I'm off for a ride ... seriously ... I am :-)

I should mention that the spare tire I carry was one that I obtained relatively inexpensively, as it was clearances out somewhere, and happened to be the right size. If that weren't the case, I wouldn't carry a spare tire.

3187. Re: [BMHA] Bike tools

Yahoo group: BMHA
Date: 2015-06-09 16:41:02 UTC
From: AE2T
Topic: 3181 Message: 3187

I've read long on this topic and will add my two cents.

Tire irons: worthless. I've seen more damage to tubes and tires done by them. All you need to get a tire off is a thing called a Quick Stick <https://youtu.be/3L8bYUjLOvQ>. Nothing more than you hands is required to put a tire on, no matter how tight the bead is, if you learn how to do it.

Pumps: For a frame pump, Topeak Road Morph, <http://www.topeak.com/products/Pumps/RoadMorphG>or similar. Works like a floor pump. Built-in gauge. They make versions that are shorter for mountain bikes. You don't want to cheap-out on a pump. Nothing is more frustrating than riding home on a half-full tire because your pump couldn't do the whole job. I wasn't impressed with the pump in the first kit. Too plasticky. The Topeak has metal in it and replacement parts are available for the rest.

Multi-tools: There are plenty out there. Some are overkill. Find one that has just what you need. Sometimes you will need to use two tools at the same time. If they are both on the same multi-tool, what do you do?

I carry a small 4 or 6 in. adjustable wrench. And a small flat-blade screwdriver. A small Leatherman tool might be good too. The pliers come in handy, as might a knife.

A spoke wrench to fit your wheels. You can ride a long way on a wheel missing a spoke if you can adjust a couple on either side to compensate.

Carry a couple of quick links for your chain. They weigh nothing. A chain tool goes along with that.

I love those three-way tools too, but sometimes they don't fit in or turn where you need. For allen wrenches, something like this <http://www.amazon.com/TEKTON-2500-Metric-Wrench-14-Piece/dp/B0037GWANO/ref=sr_1_11?ie=UTF8&qid=1433863922&sr=8-11&keywords=metric+hex+wrenches>
is good. Take off the sizes you don't need.

Instead of gloves, a couple Handi-Wipes or alcohol preps take less room.

Patch kits are patch kits, unless you use some special tube. They're cheap - buy 2 or 3 every season because once you open the tube of glue, it will be dried up the next time you need it! I have bought just the glue in small tubes, but it's hard to find. I wish someone would put it in single-use foil packages and put one per patch in kits.

Presta or Schrader? Presta. Presta. Presta. Did I say Presta? Standardize on it across all your bikes and never have to fumble around

changing the little parts in your pump head out on the side of a road. If your rims are drilled for Schrader, they make reducers to use with Presta tubes. Schrader valves are for cars. Never fill a bike tire at a gas station pump.

Your tool kit is a pretty personal collection of tools. Of course, there is no point in carrying any tool that you don't know how to use. You also need to balance the likelihood of needing a tool and the severity of being caught without it against lugging it with you everywhere. The tool kits you posted links to are nice starting points, but only you can say if they are worth it or if you'll end up replacing half the items in them. You could just buy a seat or frame bag and fill it yourself.

Good riding, 73,

Al AE2T

Hi Cliff

I am sorry to hear about your problem with the trike. I am glad that you didn't get hurt very bad, and are OK now. Mike, NF0N myself and Keith (cant recall what his call is right now) were at the BMHA ride this year, but not a lot of people showed due to the possibility of bad weather. We were there and had a nice chat while waiting for others to show.

The park police stopped (same guy as last year, he remembered my van!) and he was concerned about our ride due to storm warnings that were issued.

I hope that next year I will be able to make it to the Hamvention again, and we can have a good ride on Saturday (weather permitting). I hope to see you again next year!

Hi everyone,

Anybody here using the Strava app? We created the DX Cycling Club and you are welcome to join over at https://www.strava.com/clubs/DXCC

I will be coming to the United States on July 4th, cycling from Florida up the East Coast to New York, New England, then into Canada.

Will be QRV on VHF along the way using my new US call K9DXX.

From: Nick Kemp
Topic: 3191 Message: 3192

Obviously eBay is an option for replacement shifters. But until you get the replacement shifters, try wrapping the grips in bar-end-tape. You could also try loom tape (nontacky tape similar to electrical tape). If you use electrical tape make sure it is good quality like 3M or it will be worse than the original stickiness.

Another option is to whip it with paracord. Here are a couple knots to use:
-
http://www.buildeazy.com/house_property_makeover/rope_swing_04_07_whip_knot.html
- http://www.netknots.com/rope_knots/french-whipping/

I hate it when the rubber/plastic gets tacky and It has happened to a a variety of things from wine preservers to camcorders.

I know this is over a week old, but I had the same problem on my Bike-E recumbent with the Sram shifters. I'm living with it because the cost for brand new shifters (since they can't replace just the rubber) was prohibitive. I'm living with the melted rubber at the moment.

I use the glueless patches because every time I needed a patch my tube of glue was dried out. Glueless work to finish your ride but are not permanent. I always put in a new tube when I finish my ride. I carry two tubes and use the patches as a backup.

FWIW and based on my experiences as a rider and a shop employee, glue on patches flex and stretch with the tube, stick ons I've tried don't. A shot of Slime or other sealant might work, but as I disremember, sealants are to be injected so that the entire inside of the tube is coated before a puncture. When I repaired flats in the shop I absolutely hated a tire with the inside fouled by sealant because it required a lot of cleaning to prevent the tube from being stuck to the tire. There are a lot of puncture resistant tubes, liners and tires that I would recommend over sealants; when we bike in central or eastern Washington, where goat heads abound, I use puncture resistant tire liners and reduce our tube sizes.Again, FWIW/YMMV.bobke7hzb

Some peel and stick patches work better than others. Some that look like a piece of Scotch tape work but fail some years later. The Slime peel and stick patches seem to adhere better and are my preference at this point. I agree with the other post about tubes of glue that are glue no more has been my experience and a hardened tube of glue when you are miles from wherever is not a solution. I always have a few peel and stick patches just in case.

Another thought ... do not touch the adhesive! id educes the ability to stick... especially the non Slime patches.

I carry two tubes and patches that don't need glue. Tube glue is not recommended if the humidity is really high because the solvent in the glue evaporates rapidly lowering the coated area temperature to the dew point. The adhesive will not work with a film of condensed water on it.

Topic: 3194 Message: 3199

I wouldn't be concerned about humidity.

Patches on Butyl rubber tubes are not technically glued. They are called self-vulcanizing. The glue you use is a cleaning/solvent that softens the surface of the tube and makes it porous and open to adhering to the patch. The new surface of the patch, when you peel the backing off, is already this way.

The adhesion between the patch and the tube is more like a weld, than glued, if done properly. If any moisture were between the two surfaces, it could simply be squeezed out during the process of pressing the patch on the tube.

The glue should be spread thinly and allowed to evaporate until dry before the patch is applied. I have seen people accelerate this process by lighting the solvent with a match then blowing it out. I suppose this would also warm the tube and prevent condensation.

If you have so much evaporation of the solvent that it causes condensation, then maybe you are using too much glue.

Topic: 3194 Message: 3203

I've been riding bikes and patching tubes for 50+ years. Please don't tell me I'm using too much glue. The condensation formed when the dew point is reached due to solvent evaporation destroys the bond. It is a micro thin layer of water that can't be squeezed out as you suggested.

3204. Re: Bike tube repair

Yahoo group: BMHA
Date: 2015-08-10 07:52:33 UTC
From: ae2t@...
Topic: 3194 Message: 3204

Sorry. I only offer it as a possible explanation. In MY 50+ years of riding, in a very humid part of the country, I have never seen condensation produced by evaporation of the solvent, nor even heard of it. If it's a "micro-thin layer" as you suggest, then I think you haven't "seen" it either and are using it as a scapegoat for the problem. The amount of evaporative cooling from a small amount of solvent is negligible. But it's as good an excuse for why your patches don't stick as any, I suppose. It is not that hard to get a good patch made.

I have had tubes, in the past, with half-a-dozen patches on them. I have had patches that looked like they weren't sticking with corners that were loose, but when I pulled them off, they were so strong, they tore the tube. And, yeah, I've had some that inexplicably didn't take and needed to be redone. Probably more were ruined by my own sweat than any condensation.

3205. Staying on topic (moderator discussion)

Yahoo group: BMHA
Date: 2015-08-15 20:20:44 UTC
From: AA6WK@...
Topic: 3205 Message: 3205

The central purpose of BMHA is a forum for those of us who enjoy combining the activities of bicycling and ham radio.

The other moderators and I have noticed a growing trend for posts to be either bicycling-only or radio-only -- having a few of these is okay but it is getting to the point where we are losing the value we have as being a unique place where the hobbies are mixed.

We are also seeing a larger number of "for-sale" and other diverging topics.

The other moderators and I don't plan to apply a heavy hand, but we would like to encourage you to post material that is relevant to both bicycling and ham radio. If it is a bicycle-only topic, or if it is a radio-only topic, then there are many other forums that can be used.

Thank you for your understanding.
- Skip AA6WK and the other BMHA moderators.

3206. Staying on topic (moderation change)

Yahoo group: BMHA
Date: 2015-08-15 20:30:13 UTC
From: AA6WK@...
Topic: 3206 Message: 3206

Our BMHA group is unique in that we are a blend of the hobbies of bicycling and ham radio. Our group is devoted to the intersection of these activities (meaning that we do both).

Recently the other moderators and I have seen an increase in bicycle-only or radio-only topics (including for sale listings of radios that can't be used on a bicycle).

To keep this group focused on the intersection of bicycling and ham radio, the moderators have decided to re-affirm that postings here should reflect on material that reflects doing these activities together. There are plenty of bicycle-only and/or radio-only venues for material that relates to only one activity.

We also realize that this is a grey area and we don't plan to be too strict about this. But we do ask that future postings be of interest to both bicycling and ham radio as a combined activity.

Thank you,
Skip AA6WK and the other moderators

3207. CounterPoise

Yahoo group: BMHA
Date: 2015-09-25 12:09:43 UTC
From: ron huebner
Topic: 3207 Message: 3207

I am running a Dual Band HT with a Browning 5/8-wave antenna on a rear rack. It is mounted with a trunk type wrap around mount. It is working, but like any good ham, I would like to improve reception and transmission. I have read that others have good luck using a 1/4 wave counterpoise. On my Browning mount, the shield seems to be isolated from the mount. I haven't metered it out yet, this is just my perception due to the rubberized parts that are visible. If this is true, what is the best way to couple the counterpoise to the ground/shield? I'm thinking about making a very thin washer out of aluminum can material to put between the antenna and the screw mount. Anyone have experience with a setup like this?
I was initially going to go with a 1/2 wave antenna as it supposedly doesn't need a ground plane, but read the experience of another published user that the 5/8-wave actually works better than a 1/2 wave on a bicycle...comments?

From: w5aox@...
Topic: 3207 Message: 3208

"Another published user" is one opinion against many others. Most any antenna will work "better than another" depending on which direction it is facing, whether your body is blocking the transmit path, how much metal is under the antenna.... etc, ad infinitum. Asking for antenna comments from hams is asking for wildly divergent opinions and experiences, often with the most comments coming from the least experienced.
I severely doubt your Browning antenna is isolated from ground, otherwise it would not work well at all.
In general, a 5/8 wave antenna works best when mounted on a decent ground plane. It theoretically exhibits a bit of gain over a 1/2 wave dipole under ideal conditions. A bicycle is not in the list of ideal conditions.
I love my homebrew J poles made from fiberglass bicycle flag poles because, even with the limitations, the RADIATING part of the antenna is the highest 38" of the J pole. These would work better with proper decoupling such as ground radials but the lack of ground does not hurt performance with the J pole as much as it does with the 5/8 wave or other current fed antennas.
Adding a counterpoise would undoubtedly help your range, but would it be worth it? I cannot see where 19 inch radials sticking out horizontally would fit anywhere on any of my bikes unless above head level on a pole, and that increases the tree-whacking problems.
Whatever you do, remember that mounting the antenna directly somewhere on the bike frame means the feed point and most of the rest of the antenna is closer to your body and other stuff that absorbs and distorts RF patterns. Basic physics applies to bicycle ham antennas just as with any other antenna.... "If it lasts all year round, it ain't big enough or high enough."

Meter the antenna to find out for sure.
I had a friend that was having marginal results with the antenna on his truck. We metered the antenna an coax to find out it was perfect. Then after a full morning of checking, adjusting, re-positioning the antenna we found the truck body was isolated from ground by rubber mounts. Same thing can happen depending on what your antenna is mounted to.
I run a 1/4 dual band on my bike rack using the old CB radio Truckers Mirror mount. Everything is metal to metal and it works fine around town. If I go anywhere there is going to be traffic (City Buses) I replace the 1/4 with a 80 inch collinear that Hustler sells. It also works well and increases the range. The main purpose is to keep the buses coming up behind me away from me. Nevada has a 3 foot rule for vehicles passing a bicyclist. I've had bus mirrors with in inches of my helmet. Swinging the 80 inch makes them move into the next lane.

As previously mentioned. There are lots of combinations for you to checkout. First use the meter to verify the situation
Good luck.

The fuel for locomotion is in my fat gut. :-)

I wouldn't use a generator if that's what you mean. The power for running the amplifier would come from a heavy deep-cycle lead-acid battery with a voltage booster. Fortunately, I have very strong bicycle legs; the only thing on me in good shape. Of course, even I might not be able to pull that battery and all the other equipment. That's why I want to contact the person who already did it.

3223. BMHA Forum at the Dayton Hamvention 2016

Yahoo group: BMHA
Date: 2016-03-16 19:25:22 UTC
From: nf0n@...
Topic: 3223 Message: 3223

We will have a BMHA Forum at the Dayton Hamvention in 2016. Details below:

==========

Sunday May 22, 2016 09:15 - 11:30

Bicycle Mobile Hams of America (The 26th Annual BMHA forum at Hamvention)

Moderator: Mike Nickolaus, NF0N

Bicycle Mobile Hams of America got its start in1989 when a QST article by Hartley Alley, NA0A asked hams who operate their radios while bicycle-mobile to get together and form a group. BMHA hosts a website along with the BMHA Yahoo Groups forum.

Jeff Slattery: N8SUZ GOBA Communications Director
The Great Ohio Bicycle Adventure is the largest bicycle tour in the country with communications support provided entirely by ham radio. Participants bike 50-60 miles per day during the third week in June. Jeff Slattery, N8SUZ, has been GOBA Communications Director for 16 years. He will provide an overview of how a new communications plan is developed for touring a different area of Ohio each year along with a review of on-tour communications operations. GOBA will be in southwest Ohio for 2016.
Keith Miller: KA9RSL
A design project for a bicycle mount for the Elecraft KX3. Keith will have the bike, radio and antenna on display. The presentation will include photos and description of the building process.
We plan to have bicycle mobile displays and demonstrations of each will be conducted.

Mike Nickolaus, NF0N
BMHA Forum Moderator

==========

BMHA Bike Ride

Although a formal bike ride is planned, we are encouraging a "Show and Go" ride for those who are interested. More information to follow as to where and when. It will be on the same trail and park as in past years.

Mike, NF0N

Topic: 3224 Message: 3224

I lost a good friend, bicycling buddy and Ham Radio friend last Friday, March 25, 2016. Chris was only 55 when he passed away. He was in PA visiting family and riding bike near Gettysburg. Chris was a BMHA member, long time RAGBRAI rider and supporter, authoring a website called "Virtual RAGBRAI" for many years. Chris was a presenter at several BMHA Hamvention forums and assisted Hartley, NA0A, for several years at the forums.

I will always remember Chris as the person who I rode many bicycle trips together and at everyone of the rides, something big always happened. Never a dull moment.

Chris and I organized a team for RAGBRAI in 1989 which became called Team Megacycles, and is still a RAGBRAI team. Chris organized each yearly ride and I was able to provide the RV each year.

For those who would like to see more about Chris, the RAGBRAI website, ragbrai.org, has a tribute to him and a number of posts about Chris.

Rest in peace Chris, one can never forget such a person.

Chris Charron, K0PE, ex-WB0RSW

The Central States VHF Society is excited to announce its Golden Anniversary Conference, hosted for the 3rd time by the Northern Lights Radio Society - NLRS to be held in the rolling hills farm country of Rochester, MN Thursday, July 28 to Sunday, July 31, 2016. Rochester is home to one of the largest Amish communities west of the Mississippi and to the world renowned Mayo Clinic. We invite you to come to Rochester to help celebrate this very special 50th Anniversary Conference!

Be sure to like the Northern Lights Radio Society - NLRS FaceBook page for up to the minute information. https://www.facebook.com/NLRSO/

The conference will feature many exciting activities, including state-of-the-art technical programs, noise figure measurement, antenna range, "Rover Row", "Dish Bowl", "VHF 101" presentations for newcomers to weak signal operation, luncheons, evening socials/hospitality suites, and, of course, the ever-popular grand finale banquet. Also, as this is the 50th anniversary of the CSVHFS and conference, we will have "Gear of Yesteryear" presentations and demonstrations to reflect on where we've been and just how far we've come!

Bring the whole family! The Conference hotel includes an indoor water park suitable for all ages. It is also near beautiful downtown Rochester, where shopping and other entertainment abounds. We will also be offering a choice of side trips designed to entertain the entire family.

Additional details are available on the Central States VHF Society web site, <CSVHFS.org>. Online conference registration will be available by April 15th,
2016 under the "Annual Conference" heading, or at <2016.csvhfs.org> directly.

The CSVHFS 50th Anniversary Conference is an ARRL-sanctioned Operating Specialty Event.

CONFERENCE DATES: Thursday, July 28 - Sunday, July 31, 2016.

3228. KX2 transceiver bike mounting?

Yahoo group: BMHA
Date: 2016-05-28 17:30:14 UTC
From: n6kr@...
Topic: 3228 Message: 3228

Hi all,

We have a new all-band/multimode transceiver, the KX2, which is about half the size of the KX3. I'm looking for suggests on how to mount it to my Trek hybrid bike.

A third party is working up an injection-molded, snap-in plastic backplate for the radio itself. This backplate will have a 4-hole RAM mount pattern. Presumably it's then a question of how to get from the plate to the handlebars.

Also, what whip antenna would you recommend for 17 and 20 meters? (The KX2 has a wide-range ATU, which will help.)

Hi Wayne,
For about 15 years i used conduit hangers.
I'm in an airport now and don't have access to my computer where the pix are located. But I think there are some pictures on my web site W9XS.US

I also used an outboard tuner AH4 from Icom and my antenna was a 102" whip. Covered 40 through 10

Good luck with your HF bike mobile.

73,

Ron

Howedy Wayne.

If the backplate is going to have a 4-hole RAM mount pattern (I thought the RAM ball mount only used 2 holes)... then why not just put a RAM ball mount onto the backplate... put a RAM handlebat mount (basically the RAM ball mount with a u-bolt)... and use a 3" or 6" RAM arm to connect them???

Thats what I did for my FT-817. a place online was selling a mount for the FT-817. I bought one. I didn't like the mounting system they had to attach the mount to something. So I removed their mounting system, drilled a couple of hole on the plate... and put a RAM ball mount onto the mounting plate. I then got the RAM handlebar mount and a 6" RAM arm... and I have my FT-817 on my handlebar.

I can't recommend a antenna. I use the Diamond HV-7A on my bike. The antenna comes with 10m/6m/2m/70cm... and I bought the extra coils for 15m, 17m, 20m, and 40m (I cut a longer whip for the 10m coil so it could be used on 12m).

Thanks, Mike. I didn't know if RAM made handlebar mounts.

As for the antenna, I'm considering a Hustler 17-m whip. The KX2's ATU will tune this on 20 and 17 meters as well.

Hi, Ron. Great info on your web site. Thanks!

The KX2 is less than half the size of an FT-817 (etc.) so a handlebar mount should be easy. I hope its 10 watts is enough in SSB mode. The internal Li-ion battery should be good for a few hours of typical ops.

Regarding CW: The rig also has the keyer paddle attached, so it'll be easy to give bike CW a try. I've done it in the car, so why not :)

Howdy Wayne.

Yup... Its advertised as a "motorcycle mount"...

http://www.gpscity
com/ram-mount-steel-u-bolt-motorcycle-mount-base-ram-b-231u.html
http://www.gpscity
com/ram-mount-large-stainless-steel-rail-u-bolt-base-with-1-inch-ball.html

I bought 2 of these... one for mounting my FT-817 to and one for
mounting a GPS to (incase I bring my old TH-D7A with me and I
want to do APRS). They have them with zinc u-bolts and stainless
steel u-bolts (I bought the mounts with the stainless steel u-bolt).

I had put on e of these on the mounting plate for my FT-817...

http://www.gpscity.com/ram-mount-diamond-plate-with-1-inch-ball-ram-b-238u
html

And then I bought one of these to attach my FT-817 to my handlebar...

http://www.gpscity.com/ram-mount-medium-arm-b-socket-ram-b-201u.html

I've had the setup for a couple of years and its worked great.

consider aircraft clamps. They are aluminum had have a rubber lining so
they would protect the bars. [image: Inline image 1]

I would certainly try to find a way to dampen the vibration into the radio.

Suspend it with shock cord like a studio mike?

Have you tried eBay and searching for something like "bicycle handlebar (clamps, mounts)"? There are over 20,000 Buy It Now items (many repeats). There may be something there that would work.

Search eBay for "Outdoor Bike Bicycle Cycling Water Cup Bottle Cage Holder Handlebar Mount" they are $1.30 delivered and may make a good starting point. You could use two of them.

FFT ... Food For Thought,

Did you see my Salsa Fargo with the KX3 at hamvention? I had it in your booth when I was talking to Scott. It was one of the programs at BMHA forum. For the KX2 I have 2 different RAM mounts coming to try. I will be making a mount similar to the one I built for the KX3 and also trying one of Scott's mounts when he has it available for me. Since this will be used for loaded touring the radio and antenna must be mounted to work with the bags. The mount on the bike works but not well with the Revelate Harness I use on the handlebar. I expect the RAM mounts with Scott's or my new cradle to work much better.

My antenna is a Buddipole mini coil and 3 element shock corded whip with stinger mounted on a 2x2 aluminum angle on a rear rack. This is bonded to the frame of the bike for a counterpoise ground.

If you want any pictures let me know.
I will be using this rig on the GAP/C&O trip in September.

Wayne,
A couple more comments about my KX3 mount and the changes I will be making to the KX2 mount.
In the previous post I mentioned that it was difficult to use the Revelate Harness with the mount.
Also it takes time to remove the radio from the bike. (about 5 minutes)
I have 2 RAM ball handlebar mounts on order. One is easily removed from the handlebar the other will take a wrench so the ball mount will likely stay on the bar and the rest of the mount be removed. I will be testing those along with Scott's and my mounts for security on a bike.
I know from use with the KX3 that my mount design is secure and works well. It is not a design that is practical to put in production at a reasonable price. Both mounts will be tested so I can recommend something secure, practical and easy to use.

Check out my album NE9KM KX3 and KX2 bike mobile in the group photos.

Wayne, I am using RAM mount components to mount my aluminum KX2 mount to the bike.

RAM part RAM-B-202U on the back of the mount
RAP-B-400U or RAM-B-231ZU to mount to the handlebar.
arm of your choice length to connect them. For the most security I would recommend using the shortest that will work for you. I use these RAM parts to mount the GPS in my experimental plane and have good results. If they work well with the KX2 I will also change my KX3 mount to RAM parts.

I have the first cradle made and second one nearly finished. The RAM parts will be here tomorrow I hope to have it on the bike by tomorrow evening. When testing is complete I plan to powder coat them to match the radio.

2 photos of the KX2 mount are added to the album. The mount was made the same length as the KX3 mount. This left it about 1.5 inches longer than the radio. I did this to give protection to the connectors on the ends of the radio. If I decide that this is unnecessary I can always cut the extra off. This one uses the screw for the foot to hold the radio in the cradle.

3242. W8AQ Introducing Myself

Yahoo group: BMHA
Date: 2016-07-01 15:31:25 UTC
From: jackkneal@...
Topic: 3242 Message: 3242

Greetings es 73 everyone!

I just found and was approved for membership in this group (Thanks!) and wanted to briefly (by ragchewer standards!) introduce myself. I'm Jack Neal, W8AQ...originally licensed as WN8ZNO back in Clinton, Ohio in 1967. I've been addicted to primarily CW and cycling pretty much ever since. In the ham side, I spend a lot of time with QRP and boat anchor rigs...again usually CW.

In the cycling side, I ride anywhere from 1500-3000 miles a year, mostly on rural roads or on whatever bike trails that are handy or intrigue me enough to drive to. I've been known to bike commute (about 24 miles RT) many times a year, as well. I also find a 2-3 hour after work ride to be the perfect form of decompression..

I rode a tandem trike for awhile since I was able to configure it for bike mobile pretty easily. Had a great time with that experience using a Yaesu FT-817 and Miracle Whip (PLEASE don't start! I know and avoid the flame wars.) but have headed back exclusively to 2 wheels. Currently most of my cycling is on a Trek 520 or Trek FX 7.2. I also have MTB and fat tire bikes right now. But like most addictions, my two addictions of ham radio and Cycling have forced me to acquire a strange collection of bikes and rigs that all sort of cycle (pun intended) in and out of my life.

So obviously brief is not something I do well in posts. Apologies for being verbose but I wanted to give you a bit about myself.

TNX, 73 es hope CUAGN on the air, roads or bike trails.

Hi Jack and welcome to the BMHA group. We are glad to have you here and your interest in bicycling and Ham Radio is welcomed. Please feel free to share your enthusiasm and your interests. I also ride both 3 and 2 wheels and have some antennas and radios from time to time. I am always looking for how others do their setup. There is lot's of information on this group and on the BMHA website, www.bmha-hams.org http://www.bmha-hams.org

Again, welcome to the BMHA group and hope to see your posts.

The new location looks more bike-friendly. A plus there.

The big downside: people will have to go outdoors a lot more. There isn't nearly as much indoor space, so some things will have to be in tents. The indoor space is split among multiple unattached buildings, some of which are not air conditioned. If it rains or if it's unusually hot or cold, things are going to be less fun than they were at the Hara.

Power distribution may also be an issue. The fair isn't as dependent on availability of electricity as Hamvention is.

I'm sure the Hamvention team will do everything they can to make the new site work. There will be a few things that are better than before, and some that are inconvenient or just don't work.

I just joined this group. I have just started working with ham radio on my bianchi volpe. I am currently doing VHF/UHF via an HT and a Diamond groundless mobile antenna mounted on an Al rack on the back. I plan to purchase a LifePo4 battery from Bioenno shortly to support longer rides and a 2 meter amp.

I live in Lacey, Washington and enjoy riding on the Western Chehalis Trail system.

Does anyone use or has used the Sena SR10 bluetooth adaptors for HTs? They are a bit expensive, but, they do have a good reputation among the motorcycle folks.

I look forward to participating in the group discussions.

Regards,

Danny, KF9BD

Anyone use or have used the LifePo4 battery from Bioenno? Also, any recommendations for a dual band mobile with remote head for use on a bike? I have an FT7800 and was thinking another one of those or the newer FT7900.

Regards,

Danny

I have used their 10 amp hour 12v LifePo4 for several years. Love it. Not having the extra weight of the SLA is nice as well.

I have a 6 A-H LiFePO4 battery from Bioenno. It works great. It powered my KX3 all weekend while camping. Bioenno's customer service was very helpful with some questions I had about charging.

Not sure I would want a 200 + dollar rig on a bike. If you took a spill it might be gone. I would go with one of those 25 watt Chinese mobiles. Never used the battery you mentioned so cannot comment. The above dual bander is also smaller and lighter and no doubt easier to mount.

I have their 20Ah battery in a backpack rack (with IC7100 radio, voltage booster, and auto transmatch), for pedestrian portable to activate NPOTA units in Philly and Manhattan. Great customer service and technical answers.

Recently also bought a 50v 20Ah battery to run a 1kW amp in my minivan rover, but not recommended for bicycles. :-)

I live in a city so I get away with using my Icom IC W32 dual bander, 5 watt, in a handle bar mount. I use their external PTT switch zip tied to the handle bar near my right thumb and the headset. The antenna is the MFJ dual band that I took off of the mag mount and mounted on the rear rack. The rear rack accepted a 3/8 24 automobile mirror mount. I don't know if you are choosing the mobile radio because you need more power or not.

I have no actual experience with the battery. I did see them at Nevada Convention and sat in on the company forum. Looks promising.

Thanks for the info guys. Jay: What radio were you using with the 10 AH battery? I am interested in how the battery handles certain amp draw. I am trying to decide if I should get the 15 or 20 AH versions to power my 857D (~20 amp draw) or a dual band mobile (~10 amp draw).
Also, good comment on using one of the less expensive dual banders on a bike. I will look into that. Danny, KF9BD, Lacey, WA

I use it with my 817 all the time. I have used it with the 857 but at a reduced power output of 20-25w.
